Structures:	A rectangular, two-story building with a footprint area of approximately 40,000 square feet occupies the western portion of the Site. According to available information, the building was constructed prior to 1960.
Occupancy & Use:	The Site is utilized as a commercial property. Three 10,000-gallons fuel oil aboveground storage tanks (ASTs) are located at the Site. The building at the Site is leased to M&M Trucking as a vehicle maintenance facility.
Utilities:	No subsurface utilities were identified in the vicinity of the excavation area at the Site.
Site Access/ Barriers:	The Site is accessed from Morton Street which is located to the east of the Site or from the MBTA station which is located to the north of the Site. Train tracks for the MBTA adjoin the Site to the west.

Surface Water: There are no surface water bodies on the Site. The closest surface water body is an unnamed lake located approximately 1,450 feet south of the Site.

Population: Residential properties are located within a 500-foot radius of the Site. According to a population density map for the Town of Stoughton, the approximate population within a 500-foot radius of the Site is 25 to 75.

Institutions: No institutions, as defined in 310 CMR 40.0006, were identified within a 500-foot radius of the Site.

2.2 Topography and Drainage

Based upon a review of the 1987 Brockton USGS (7.5 x 15 minute) quadrangle map, the Site is located approximately 226 feet above mean sea level (MSL). Site topography is relatively flat. Regional topography within a 0.5-mile radius of the Site is relatively flat with topographic elevation ranging from 200 to 240 feet above MSL.

According to the June 1, 1982 Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map for the Town of Stoughton, Community Panel Number 250253 0001-B, the Site is designated as being within "Zone C," defined as an area of minimal flooding potential.

2.3 Sensitive Receptors

A Site Scoring Map, prepared by the Massachusetts GIS, was reviewed at the DEP-NERO on February 16, 1998. This map denotes aquifer yields, wellhead protection areas, water supplies, NHESP Estimated Habitats of Rare Wetlands Wildlife & Priority Habitats, Areas of Critical Environmental Concern, and other potentially sensitive receptors located within 500 feet and a 0.5-mile radius of the Site. Potentially sensitive receptors were also identified through the surficial Site inspection.

According to the GIS map, the Site is not located within an environmentally sensitive area. Zone 2 wellhead protection areas are located approximately 1-mile north and west of the Site. A Zone 2, Interim Wellhead Protection Area, Zone A of a Class A surface water body is located approximately 0.5 miles south of the Site. An area depicted as protected open space is located approximately 1,000 feet east of the Site. No additional potentially sensitive receptors were identified on the GIS map and during the Site inspection.

2.4 Geology (Literature Review)

According to the "USGS Bedrock Geologic Map of Massachusetts" (E-an Zen, 1983), Bedrock at the Site consists of the Dedham Granite, described as light grayish-pink to greenish-gray, equigranular to slightly porphyritic granite.

3.0 IMMEDIATE RESPONSE ACTION ACTIVITIES

The objective of the IRA is to removed soil contaminated by the release of motor oil at the Site, remove the improperly-stored waste oil at the Site, and determine whether groundwater has been impacted by the release. Contaminated soil was to be removed to concentrations consistent with Background Conditions at the Site.

Prior to excavation activities, a waste profile of the petroleum-contaminated soil at the Site was submitted for acceptance at Bardon Trimount in Stoughton, Massachusetts. On December 31, 1997, Mr. David Tonaszuck of DEP-SERO granted verbal permission to conduct an IRA which included the removal of up to 10 cubic yards of petroleum contaminated soil and the proper disposal of waste oil at a licensed disposal facility.

3.1 Contaminated Soil Excavation and Disposal

Mr. Thomas Hevner of CONECO arrived at the Site at 8:00 a.m. on January 5, 1998. Weather conditions during the excavation activities was clear with ambient temperatures of 50° F. During the excavation activities, the Site was inspected by Mr. Nicholas A. Lanney, P.E., L.S.P. of CONECO.

Petroleum-contaminated soils were excavated in the area impacted by the release by Hersee Company of Stoughton, Massachusetts, with oversight by Mr. Thomas Hevner of CONECO. Hersee Company personnel utilized a Case 580 backhoe during the excavation of petroleum-contaminated soils. Contaminated soil was directly loaded into a triaxial dump truck for transport to Bardon Trimount in Stoughton, Massachusetts.

The vertical and horizontal extent of the soil impacted by the petroleum release was delineated utilizing visual and olfactory observations as well as an HNu PID and a Petroflag Hydrocarbon Analyzer. The results of the field screening are presented in Section 3.2. Soils impacted by the petroleum release exhibited a dark gray to black-colored petroleum staining.

Overburden stratigraphy within the excavation consisted of field grass and gravel surface underlain by fill to a depth of approximately 1.5 feet below grade. The fill material was comprised of a buff to black-colored gravelly silty sand. Bedrock was not encountered during the IRA excavation activities.

Field and instrument observations indicate that the release had impacted a 9-foot by 8-foot horizontal area which did not extend beyond 1.5 feet below grade. A clear demarcation between contaminated soil and clean soil was evident at the horizontal and vertical extents of the release-impacted soil. Since the water table was observed during the excavation activities to be located at 2.5 feet below grade, it is the opinion of CONECO that the release did not impact the water table.

At the completion of the excavation, confirmatory soil samples were collected for laboratory analysis (See Section 3.3). CONECO departed the Site at 2:30 p.m.

3.3 Field Screening

Representative soil samples collected from the excavation were placed in clean, tightly sealed glass jars with aluminum foil cover liners for in-field screening using a PID and Petroflag Hydrocarbon Analyzer. A discussion of these procedure and standard operating protocols are included in Appendix C (Tab 3). Headspace procedures were performed in accordance with DEP Policy WSC 94-400. Table 1 presents the Field Screening Results.

Table 1 - Field Screening Results - January 5, 1998

Sample No.	Location	Depth (feet)	PID Reading (ppm)	Field Screening for TPH as Motor Oil (mg/kg)
S-1	Base	1.5	ND	29
S-2	Base	1.5	3.0	177

Note: ND = Not Detected above the instrument's minimum detection limit of 0.2 parts per million per volume (ppmv).
--- = Field Screening for TPH as Motor Oil not performed.

3.4 Confirmatory Analysis

The two base composite soil samples were composited into a single soil sample and placed in a clean 4-ounce glass jar for laboratory analysis of TPH as DRO by EPA Method 8100. The soil sample was delivered by courier on January 5, 1998, to New England Testing Laboratory located in North Providence, Rhode Island. Sampling locations are shown on Figure 2.

3.5 Remediation Waste

In accordance with 310 CMR 40.0030 (Management Procedures for Remediation Waste) and 310 CMR 30.000 (Massachusetts Hazardous Waste Regulations), the contaminated soil at the Site was removed under a Bill of Lading. A total of 2.68 tons of soil were removed from the Site on January 5, 1998, and transported to the Bardon Trimount located in Stoughton, Massachusetts for asphalt batching. A copy of the Bill of Lading is presented in Appendix D (Tab 4).

In accordance with 310 CMR 30.000 (Massachusetts Hazardous Waste Regulations), the improperly stored waste oil at the Site was disposed at a licensed facility. On March 18, 1998, 165 gallons of waste oil was transported to United Oil Recovery, Inc. by Advance Liquid Recycling. A Uniform Hazardous Waste Manifest is presented in Appendix D (Tab 4).

4.0 ANALYTICAL RESULTS

TPH was not detected above laboratory quantification limits in the composite soil sample from the base of the excavation. Original laboratory data, laboratory QA/QC, methods, and the chain-of-custody forms are included as Appendix E (Tab 5). Figure 2 presents the locations of the confirmatory soil samples and a summary of the analytical results.

5.0 METHOD 1 RISK CHARACTERIZATION

Under the MCP (310 CMR 40.0000), once a property has been classified as a Disposal Site, a risk assessment is necessary to demonstrate that a condition of "No Significant Risk" to health, safety, public welfare, and the environment exists at the Site. Otherwise, further remedial actions are required to achieve a condition of "No Significant Risk."

To determine whether further action is required at the Site, it is first necessary to determine whether a condition of "No Significant Risk" exists using Method 1 Risk Characterization procedures. The following sections present the classifications of soil and groundwater for an MCP Method 1 Risk Characterization, and the applicable threshold concentrations for the contaminants present at the Site.

5.1 Soil Categories

According to the MCP, 310 CMR 40.0933, soil at a given site must be classified as either S-1, S-2, or S-3, based upon exposure potential according to three criteria: frequency of use, intensity of the use, and accessibility. The most stringent classification for each contaminant is then used to determine the level at which contamination poses "No Significant Risk" to affected receptors. The Site soil is described as follows:

Frequency of Use: High. Adults reside at the Site and children may be present as infrequent visitors.

Intensity of Use: Low. Passive activities, such as walking and bird watching, will not have the potential to disturb the soil.

Accessibility: The area of soil contamination is located between 0 and 1.5 feet below surface grade and is considered accessible since it is unpaved.

Using these parameters, soil at the Disposal Site is classified as Category S-2.

5.2 Soil Exposure Point Concentrations and Method 1 Risk Characterization

The MCP, 310 CMR 40.0975(6)(a-c), presents the Method 1 soil category S-1, S-2, and S-3 standards associated with groundwater categories GW-1 through GW-3. The Site does not meet the criteria for GW-1 or GW-2 soil classifications.

The concentrations at the Site are compared to the applicable S-2/GW-2&3 standards to determine whether a condition of "No Significant Risk" currently exists at the Site. To account for foreseeable futures uses of the Site, the concentrations at the Site are compared to the applicable S-1/GW-2&3 standards to determine whether a condition of "No Significant Risk" exists at the Site in the future, if the exposure scenario were altered.

For the purposes of this risk characterization, exposure point concentrations in soil at the Disposal Site consist of the composite soil sample from the base of the excavation. Since TPH was not detected above laboratory quantification limit in the base composite soil sample, one-half of the analyte's detection limit was factored into the calculation of the soil exposure point concentration. Table 2 presents the Method 1 Risk Characterization for the Site soils.

Table 2 - Method 1 Risk Characterization - Soil

Classification	TPH in mg/kg
S-1/GW-3	800
S-2/GW-3	2,000
Exposure Point Concentrations	5

Notes: **Bold** - Exceeds applicable Method 1 Risk Characterization Standard.

Since the exposure point concentration for TPH is below the applicable TPH Method 1 Risk Characterization Standard, a condition of "No Significant Risk" exists for current and future uses of soil at the Site.

5.3 Groundwater Categories

As listed at 310 CMR 40.0932, groundwater at all locations is classified as category GW-3, based upon its potential to discharge to surface water. Groundwater can also be classified as GW-1 based upon potential to be used as drinking water supply, and as GW-2, based upon the potential for inhalation of vapors of oil or hazardous materials in indoor air. The most stringent classification for each contaminant is then used to determine the level at which contamination poses "No Significant Risk" to affected receptors.

The GW-1 groundwater classification evaluation for the Site, based upon a DEP Priority Resources Map, is presented in Table 3.

Table 3 - GW-1 / GW-2 Groundwater Classification Criteria

GW-1 Criteria	GW-1 Classification
1) within the Zone II for a public water supply	No
2) within an Interim Wellhead Protection Area	No
3) within a Potentially Productive Aquifer	No
4) within the Zone A of a Class A surface water body used as a public water supply	No
5) at any point located 500 or more feet from a public water supply distribution pipeline	No
6) at any groundwater sampling point located within 500 feet of a private water supply well	No
GW-2 Criteria	**GW-2 Classification**
1) Located within 30 feet of an occupied building and average annual depth to water is less than 15 feet	No

Under these criteria, the groundwater at the Site is subject to GW-3 groundwater classifications.

5.4 Groundwater Method 1 Risk Characterization

The laboratory results demonstrate that the horizontal and vertical extent of the soil impacted by the release have been delineated at the Disposal Site. TPH as DRO was not detected above laboratory quantification limits. Since the vertical extent of the soil impacted by the release has been delineated at the Site and groundwater was not encountered during the excavation activities, a condition of "No Significant Risk" exists for groundwater at the Disposal Site.

5.5 Summary of Risk

Conditions at the Site were evaluated in respect to the definition of an "Imminent Hazard" as presented in 310 CMR 40.0950. As such, conditions which would represent an "Imminent Hazard" are not present at the Site. Background conditions were not evaluated as part of this investigation.

Since the exposure point concentration for TPH is below the applicable TPH Method 1 Risk Characterization Standard, a condition of "No Significant Risk" exists for current and future uses of soil at the Site. The petroleum release at the Disposal Site did not impact groundwater and as such, a condition of "No Significant Risk" exists for groundwater at the Disposal Site.

6.0 RESPONSE ACTION OUTCOME

Environmental conditions of the Disposal Site were evaluated in a manner consistent with guidelines presented in the "Massachusetts Contingency Plan" (310 CMR 40.0000). As a result of a release of an unknown quantity of motor oil to a limited area at the Site and the observation of improperly stored waste oil at the Site, a RNF was submitted to the DEP and the Site was subsequently listed as DEP File No. 4-13478.

On December 31, 1997, Mr. David Tonaszuck of DEP-SERO granted verbal permission to conduct an IRA which included the removal of up to 10 cubic yards of petroleum contaminated soil and to properly dispose of the waste oil at a licensed disposal facility. The objective of this IRA was to remove petroleum-contamination soils impacted by the release of motor oil to background concentrations and determine whether groundwater had been impacted by the release. Petroleum-contaminated soil was to be removed to concentrations consistent with Background Conditions at the Site.

Immediate Response Action

- On January 5, 1998, 2.68 tons of petroleum contaminated soil were excavated at the Site and transported to Bardon Trimount in Stoughton, Massachusetts for destruction by asphalt batching. On March 18, 1998, 165 gallons of waste oil was transported to United Oil Recovery, Inc. by Advance Liquid Recycling.

- A clear demarcation between contaminated soil and clean soil was evident at the horizontal and vertical extents of the release-impacted soil. Field screening of composite soil samples at the Site with a PID and Hydrocarbon Analyzer supported this visual observation.

- Overburden stratigraphy within the excavation consisted of field grass and gravel surface underlain by fill to a depth of approximately 1.5 feet below grade. The fill material was comprised of a buff to black-colored gravelly silty sand. Bedrock was not encountered during the IRA excavation activities. Upon further excavation, the water table was determined to be located at a depth of 2.5 feet below grade.

Risk Characterization

- The exposure point concentration for TPH is below the applicable TPH Method 1 Risk Characterization Standard. A condition of "No Significant Risk" exists for current and future uses of soil at the Site.

- The vertical extent of the soil impacted by the release has been delineated at the Site and groundwater was observed at a depth of 1-foot below the base of the excavation. As such, it is the opinion of CONECO that groundwater was not impacted by the release of motor oil at the Site. A condition of "No Significant Risk" exists for groundwater at the Disposal Site.

- Since the TPH concentration in soil at each sampling location are below the applicable Method 1 S-1 standard as specified in 310 CMR 40.0900, background concentrations in soil are considered approached by CONECO. Additionally, since groundwater was not impacted by the release at the Disposal Site, an evaluation of whether background concentrations have been approached in groundwater is not applicable.

- The intent of the IRA was remove petroleum contaminated soils to background concentrations, remove the improperly-stored waste oil at the Site, and determine whether groundwater had been impacted by the release. As such, the objectives of the IRA have been accomplished and an IRA Completion Statement (BWSC-105) is presented as Appendix A (Tab 1).

Response Action Outcome

- A Permanent Solution has been achieved and the level of TPH in soil approach background. Groundwater was not impacted by the release of motor oil at the Site.

- A condition of "No Significant Risk" exists for current and future uses of soil and groundwater at the Disposal Site.

- The IRA has eliminated all threats of release (i.e., improperly stored waste oil and exterior equipment storage).

- Conditions for a Class A-1 RAO have been met at the Site in accordance with 310 CMR 40.1035 and 40.1036(1). Copies of public notice requirements, and the original DEP transmittal forms are included in Appendices F (Tab 6) and A (Tab 1), respectively.

7.0 LIMITATIONS

The conclusions expressed by CONECO in this report are based solely on the references cited. Observations were made under the conditions stated. Information provided by federal, state, and local agencies contacted was relied upon as accurate and complete. The purpose of this study was to establish via a limited scope of work whether there is evidence that a release of oil or hazardous materials has occurred at the Site or that a threat of release exists. This report represents CONECO's opinion relative to such evidence. Unless otherwise specified in the scope of work, CONECO accepts no responsibility for client performance of recommendations as may be offered in this report. No attempt was made to investigate Site owner or operator compliance with federal, state, or local laws and regulations in connection with Site usage.

With specific regard to subsurface explorations, data obtained from the test borings may not be wholly representative of the nature of subsurface conditions at locations other than the actual test location. Variable conditions may only become evident upon further exploration. Should

additional information become available concerning this Site or neighboring properties in the future, that information should be made available to CONECO for review so that the conclusions presented in this report may be modified as necessary.

1.0 INTRODUCTION

The following information is provided in support of a Class A-1 Response Action Outcome Statement prepared in accordance with the Massachusetts Contingency Plan (MCP) 310 CMR 40.1000 for the Getty Service Station located at 825 Washington Street, Stoughton, Massachusetts (the "site"). A Site Location Map and a Site Plan are included as Figures 1 and 2, respectively. This statement provides the required information necessary to support a finding that the reported gasoline released to the environment at the site has been reduced to a level of No Significant Risk as defined by (MCP) 310 CMR 40.1036(1).

2.0 BACKGROUND

The subject property is located approximately 200 feet south of the intersection of Washington Street (Route 138) and Park Avenue (Route 27) in Stoughton, Massachusetts. The property contains a one-story building which is used as a service station with one dispenser island. The site maintains four active gasoline underground storage tanks (USTs) located on the north side of the property.

On January 2, 1996, organic vapors were detected in the basement of the Veterans of Foreign Wars (VFW) building, located at 837 Washington Street, Stoughton, Massachusetts. The VFW building is located along the southern property boundary of the site. The source of the vapors has not been determined, but Getty Petroleum Corp. (Getty) voluntarily began a vapor assessment program. The Massachusetts Department of Environmental Protection (DEP) was contacted of the probable release on January 2, 1996, by Michelle Grenier of the Stoughton Environmental Office. Since the origin of the release was believed to be the service station, the DEP issued Getty the release tracking number 4-11868 identifying the service station as a disposal site. On January 4, 1996, Michael Moran of the DEP verbally approved an Immediate Response Action Plan which consisted of installing a soil vapor extraction system (SVES) to recover the organic vapors and conducting additional assessment. On January 18, 1996, DEP issued a Notice of Responsibility (NOR) to Getty for the release.

3.0 VAPOR MONITORING PROGRAM AND SVES OPERATION

On January 2, 1996, Tyree Organization, Ltd. (Tyree) was retained by Getty to assess the reported detection of organic odors in the basement of the VFW building located at 837 Washington Street. A Tyree environmental scientist monitored organic vapor levels in the basement of the VFW building, as well as the Getty Service Station, using a photoionization detector (PID). The area of the basement located along the northern side of the VFW building exhibited the highest PID readings, which were monitored between 58 parts per million (ppm) and 96 ppm. There were no detectable levels of volatile organics in the ground floor of the VFW building or in the Getty Service Station.

From January 2, 1996 through September 24, 1996, the VFW basement was monitored on 46 occasions. PID readings ranged from 86 ppm on January 2, 1996, to below detection limits on September 24, 1996. A summary of the Air Monitoring Data is included on Table 1.

On January 4, 1996, Tyree completed the installation of the SVES and operation of the SVES commenced. The SVES consisted of two vapor extraction wells located on the southern side of the Getty Service Station, adjacent to the VFW basement wall. A Rotron blower was used as the vacuum source to extract VOC vapors from the vadose zone. One 55-gallon drum of granular activated carbon (GAC) was used to treat the vapors prior to discharge to the atmosphere. The SVES was housed in a portable trailer which was surrounded by concrete barriers. Influent and effluent vapors were monitored using a PID. During the monitoring period, influent PID readings ranged from an initial reading of 100 ppm monitored on January 15, 1996 to 1.8 ppm monitored on June 19, 1996. Effluent PID readings ranged from 0 ppm to 40 ppm periodically during the six months that the SVES was in operation. Due to the PID reading of 40 ppm in the SVES effluent on February 23, 1996, the granular activated carbon air treatment vessel was replaced on March 15, 1996. A summary of the Air Monitoring Data is included as Table 1.

Due of the consistently low levels of organic vapors in the influent of the SVES and the non detectable organic vapors in the VFW basement, Tyree shut the SVES off on June 26, 1996. During the period between June 26, 1996, through September 24, 1996, vapors were monitored in the VFW basement on 8 occasions. Organic vapors were not detected during any of the monitoring events. On October 1, 1996, the SVES was removed from the site.

4.0 SAMPLING RESULTS

4.1 Soil Sampling and Analysis

On January 25, 1996, five soils borings, designated as SB-1, SB-2, SB-3, SB-4, and SB-5 were advanced between the VFW building and the Getty Service Station. The locations of the soil borings are depicted on Figure 3, Soil Boring Location Map.

Soil samples were obtained continously throughout drilling operations to approximately 6 to 8 feet below grade, where refusal was encountered. Groundwater was not encountered at any of the boring locations. Soil samples collected from the split spoon sampler were field screened for volatile organic compounds (VOCs) using a PID. PID readings ranged from below detection limits to 7.2 ppm. PID readings are included on the Boring Logs found in Appendix A.

Soil samples exhibiting the highest PID measurements were submitted to Environmental Testing Laboratories, Inc. (ETL), in Farmingdale, New York, a state certified laboratory for analysis of VOCs plus MTBE by EPA Method 8240 and Total Lead. According to the laboratory analytical report, lead was reported as detected in soil samples SB-1, SB-2, SB-3, SB-4, and SB-5, but

below the MCP Method 1 S-1/GW-1 Soil Standard. All additional compounds analyzed for by the specified analytical methods were reported below detection limits for all soil samples. A summary of the soil analytical data is included as Table 2 and depicted in Figure 4. The laboratory analytical report is included in Appendix B.

4.2 Air Sampling and Analysis

On May 15-16, air samples were collected from the VFW basement and from the SVES influent and effluent. Air samples were collected by passing 2 liters of air through a carbon vial. The carbon vials were submitted to ETL for the analysis of VOCs by EPA Method 8240. Results of the analysis indicated that all the compounds analyzed for by the specified method were below detection limits for all four samples collected. A summary of the air analytical data is included in Table 3 and the laboratory analytical report is included in Appendix B.

5.0 RISK ASSESSMENT

The MCP requires that all feasible means should be taken to mitigate the impacts of any release until a level of "No Significant Risk" has been achieved. The MCP also requires that the remedial actions taken to reduce the risks associated with the release shall reduce, to the extent feasible, the concentrations of oil and hazardous material to "background" levels that would exist in absence of the release. A review of Tables 2 and 3 shows benzene, toluene, ethyl-benzene, total xylenes (BTEX), methyl tert-butyl ether (MTBE) have been reduced to background levels. The concentration of lead in soil samples collected was was below the DEP accepted lead background level of 99 ppm. Therefore, a level of No Significant Risk has been documented as being attained at this site.

6.0 MANAGEMENT OF REMEDIATION WASTE

As a result of drilling activities on January 25, 1996 at the site, three 55-gallon drums containing drill cuttings were generated. The drums were disposed at Environmental Waste Resources, an approved disposal facility in Waterbury, Connecticut. A hazardous waste manifest for this waste is included in Appendix C.

Due to the replacement of GAC for the SVES, 200 pounds of GAC were disposed of at an approved disposal facility. According to the GAC supplier, the GAC is not hazardous and does not require the hazardous waste manifest procedures.

7.0 CONCLUSIONS

Based on site observations and analytical tests performed on confirmatory soil samples, the following conclusions have been reached:

1. The reported release of gasoline to the environment that occurred at 825 Washington Street, Massachusetts has been successfully mitigated by implementing soil vapor extraction.

2. A permanent solution has been achieved and background levels of contaminants have been achieved.

3. The conditions of a Class A-1, Response Action Outcome, as outlined in 310 CMR 40.1036(1) have been met.

8.0 SUMMARY

In accordance with the MCP 310 CMR 40.0000, a Class A-1 Response Action Outcome (RAO) Statement is being submitted to MADEP.

9.0 DISCLAIMER

This Response Action Outcome (RAO) Statement has been prepared for the use of Getty Petroleum Corp and/or its designated agents. Reasonable due diligence was exercised by the staff of Tyree Organization, Ltd. in performing field work and writing this document. The conclusions provided by Tyree in this report are based solely on the information reported in this document. Future investigative site information which was not available to Tyree at the time of this statement may result in a modification of the conclusions stated above. The conclusions presented are based upon the current regulatory climate and may require revision if future regulatory changes occur. This investigation and report has been conducted in accordance with generally accepted practices. No other warranty, expressed or implied, is made.

Summary of Historical Site Information

Getty Service Station No. 30646
825 Washington Street
Stoughton, Massachusetts
MassDEP RTNs: 4-12937, 4-13560 & 4-13682

Site Location

The site at 825 Washington Street, Stoughton, Massachusetts, is located approximately 200 feet south of the junction of Washington Street and Park Street. The Universal Transverse Mercator (UTM) coordinates for the site are 4,665,611 meters north and 326,270 meters east. The latitudinal and longitudinal coordinates of the site are 42º7'24" north and 71º6'6" west, respectively. A Site Location Map is included as **Figure 1**.

Site Description

The site is currently utilized for automobile repair and gasoline dispensing purposes. The property slopes slightly to the south, with an area about 0.33 acres in size. There is a one-story concrete-block building with two service bays, a canopy, and two underground gasoline tanks at the site. The locations of the on-site structures are depicted in **Figure 2**.

The site is located in an area of mixed commercial and residential use. The site is abutted by a residential dwelling to the north, Washington Street to the east, a Veteran's of Foreign Wars (VFW) building to the south, and a train station parking lot to the west. Located across Washington Street to the east are a real estate office and a printing office.

Potential Receptors

According to the Town of Stoughton Health Department records, two private wells are located approximately 400 feet east of the site at 48 Park Street and 31 Walnut Avenue. According to the Town of Stoughton Water Department, both residences are connected to the town water supply.

The identification of natural resources within 500 feet of the site was determined by using the Massachusetts Department of Environmental Protection (MassDEP) Bureau of Waste Site Cleanup (BWSC) Site Scoring Map in conjunction with a confirmatory site reconnaissance. According to the Site Scoring Map, no surface waters, no public drinking water supplies, and no areas of critical concern are located within 500 feet of the site.

A site reconnaissance confirmed that there are no institutions within 500 feet of the site. Based on a database search conducted by New England DataMap Corporation (NEDC) located in Dedham, Massachusetts, the estimated residential population within 0.5 miles of the site is approximately 9,520 persons. The average number of on-site workers at any given time was estimated to be 3 people.

Site History

The current owner of the property is Joe's Shell, Inc. of Stoughton, Massachusetts, who has owned the property since 1976. The site is currently utilized by Getty Properties Corp., who has leased the property since 1990, for gasoline dispensing and automotive repair services. According to records maintained at the Stoughton Building Department, the property has been used as a gasoline station since 1956.

Release History

Tyree was contacted by Getty Properties Corp. (Getty) on January 2, 1996, to respond to a complaint of odors in the basement of the adjacent VFW building located at 837 Washington Street. A Tyree environmental scientist monitored the VFW building, as well as the Getty Station at 825 Washington Street, using a photoionization detector (PID) and an explosion/oxygen meter to detect the presence of volatile organic compound (VOC) vapors. PID readings ranging from 58 parts per million (ppm) to 96 ppm were reported in the VFW basement on the northern side of the building. No explosive or oxygen deficient atmospheres were detected using the explosion/oxygen meter.

Immediate Response Actions for Vapors (RTN: 4-11868)

Michael Moran of the MassDEP Southeast Regional office was notified of the site conditions on January 2, 1996, by Michelle Grenier of the Town of Stoughton Environmental Office. Release Tracking Number (RTN) 4-11868 was assigned to the site. MassDEP granted verbal approval of an Immediate Response Action (IRA), which consisted of the monitoring of VOC vapors within the VFW building and the implementation of a soil vapor extraction system (SVES). Two vapor extraction wells SVE-1 and SVE-2 were installed on the northern side of the VFW building on January 3, 1996. The SVES was started on January 15, 1996. A 1-horsepower Rotron blower was used for the vacuum source to extract vapors from the subsurface and a 55-gallon vapor phase granular activated carbon drum was used for the treatment of vapors prior to discharge to the atmosphere. Additionally, the IRA consisted of the tightness testing of the underground storage tanks (USTs) at the Getty Station. An IRA Plan was submitted to the MassDEP outlining the conditions which were previously verbally approved.

An **IRA Status Report** dated April 24, 1996, was submitted to the MassDEP detailing the monitoring results of the SVES and the vapor levels in the VFW building. The USTs and associated piping at the Getty Station were tested for tank tightness and were found to be tight. In order to determine the source of the VOC vapors in the VFW building, five soil borings were installed in the area between the Getty Station and the VFW. Results of the soil sampling did not indicate the presence of VOCs in soil.

An **IRA Completion Report**, dated October 28, 1996, was submitted to the MassDEP detailing the results of the VOC vapor monitoring program. The IRA Completion Report concluded that VOC vapors were not detected in the VFW building with the SVES off for a period of four months. Therefore, it was determined that an IRA was no longer required at the site.

A **Response Action Outcome** (RAO), dated December 11, 1996, was submitted to the MassDEP. The RAO concluded that a level of "No Significant Risk", as defined by the MCP, had been documented as being attained at the site and that the conditions of a Class A-1 RAO were met. The RAO also documented that attempts to identify the source of the vapors through the advancement of soil borings in the area between the Getty Station and the VFW building were unsuccessful.

Immediate Response Actions for Vapor (RTN: 4-12937)

Tyree was contacted by Mr. Roy Lupino, an official of the VFW, late in the day on January 27, 1997, to respond to a subsequent complaint of organic odors in the VFW building. Mr. Roy Lupino stated that the organic odor was encountered in the morning when an office door in the basement was opened, but the odor very quickly dissipated to a non-detectable level. A Tyree environmental scientist assessed the VFW building, as well as the Getty Service Station, early in the morning on January 28, 1997. Using a PID and explosion/oxygen meter, air in the first floor, basement, outside the VFW building, and inside the Getty Service Station, was monitored for VOC vapors. The area of the basement on the northern side of the VFW building exhibited a PID reading of 14 ppm. Other areas of the VFW building and the Getty Station were monitored with a PID, but all other PID readings were less than 1 ppm. No explosive or oxygen deficient atmospheres were detected using the explosion/oxygen meter. During the inspection of the property, there was no visual evidence of petroleum staining on the pavement. Also, there were no catch basins located near the VFW building or the Getty Service Station.

The purpose of the January 28, 1997, assessment was to determine if an imminent hazard existed and if a notifiable release had occurred in accordance with the Massachusetts Contingency Plan (MCP). Based on the results of the investigation which established that there was no imminent hazard, it was the opinion of the Licensed Site Professional (LSP)-of-Record for the site that no reportable release, as defined by the MCP, had occurred.

Based on the knowledge that the vapor release was not a one time occurrence, as initially thought based on the lack of success in identifying any potential sources, Getty and the LSP-of-Record decided to initiate a more extensive investigation of possible contamination sources. As a voluntary precautionary measure, it was decided to reactivate the on-site SVE system.

On February 12, 1997, the two existing vapor extraction wells on the southern side of the Getty station were reconnected to the SVES. The SVES was installed to maintain non-hazardous conditions at the site until the source of the vapors could be found. A 1 horsepower Rotron blower is used to extract vapors from the vadose zone. One 55-gallon drum of granular activated carbon (GAC) was used to treat the vapors prior to discharge to the atmosphere.

In discussions with Getty, there was a question as to how to define the ongoing remediation activities at the site in accordance with the MCP. A telephone conversation was held with Mr. Robert Kearns of the MassDEP Southeast Regional Office and it was determined by the MassDEP that a new release notification should be made. Mr. Kearns was verbally notified of the new release conditions and verbal approval of an IRA was granted on April 4, 1997. **The Release Notification Form and IRA Plan** was submitted on May 28, 1997. RTN 4-12937 was assigned to the site.

On September 24, 1997, Tyree excavated and removed five USTs from the site. The USTs consisted of one 8,000-gallon gasoline UST, two 4,000-gallon gasoline USTs, one 4,000-gallon diesel UST, and one 550-gallon fuel oil UST. A 550-gallon waste oil UST was abandoned in place with a concrete slurry due to its proximity to the building foundation. One of the 4,000-gallon USTs was made of fiberglass construction, while the other 4 USTs were made of steel construction. No holes were reported in the USTs during removal. During the tank removals, the septic system was removed. The site was later connected to the town sewer system.

Release Notification Form (RTN: 4-13682)

During tank removal activities, excavated soil was monitored with a PID. During the removal of the 4,000-gallon gasoline UST and the diesel UST, PID readings of greater than 200 ppm were reported. Due to the site already being listed due to a release of gasoline, a new notification was not made. As documented in the IRA Completion Report submitted to the MassDEP on February 13, 1998, approximately 921 tons of soil were excavated and later removed from the site for recycling. Also, the **IRA Completion Report** indicated that Polynuclear Aromatic Hydrocarbons (PAHs) were detected in confirmatory soil samples which exceeded the reportable concentrations for soil classified as RCS-1. Therefore, a **Release Notification Form** was submitted to the MassDEP on February 13, 1998, for the 120-day reporting condition. RTN 4-13682 was assigned to the release.

Immediate Response Actions for Separate Phase Hydrocarbons (RTN: 4-13560)

On November 20, 1997, three bedrock monitoring wells, MW-3, MW-4, and MW-5, were installed on-site. During a groundwater gauging event on December 17, 1997, separate phase hydrocarbons (SPH) were reported in well MW-3, at a thickness of 0.92 feet. Mr. Robert Kearns of the MassDEP was notified of the 72-hour reporting condition on December 17, 1997. RTN 4-13560 was assigned to the release and MassDEP granted verbal approval of an IRA to monitor and bail SPH from on-site wells. An **IRA Plan** was submitted to the MassDEP on February 13, 1998, detailing the previously approved IRA.

On April 8, 1998, a **Phase I Initial Site Investigation and Tier Classification** was submitted to the MassDEP. The Phase I Report concluded that the site should be tier classified as Tier II and an imminent hazard was not present at the time of tier classification.

On July 14, 1998, an **IRA Plan Modification** was submitted to the MassDEP for the installation of four additional bedrock monitoring wells and disposal of drill cuttings and well bailings. On October 12, 1998, an **IRA Status Report** was submitted to the MassDEP detailing the status of the site activities. Four bedrock monitoring wells, MW-6, MW-7, MW-8 and MW-9, were installed at the property. The IRA Status Report indicated that monitoring of the new wells would continue on a weekly basis.

On December 16, 1998, a **Release Abatement Measure (RAM) Plan** was submitted to the MassDEP proposing an aquifer pump test on monitoring well MW-8 to determine which monitoring wells were hydraulically connected to one another. The RAM Plan was approved by MassDEP in a letter dated March 8, 1999

On April 8, 1999, an **IRA Status Report** was submitted to the MassDEP detailing the groundwater gauging and sampling activities conducted at the site. Groundwater gauging data indicated that SPH was not detected in on-site monitoring wells from January through March 1999.

An **IRA Plan Modification**, dated April 21, 1999, was submitted to the MassDEP for the proposed monitoring well pump out using a vac-truck. It was proposed that monitoring well MW-3 would be pumped out on a weekly basis using a vac-truck. The weekly pump out would continue for a six-week period, whereby groundwater samples would be collected to determine its effectiveness. Monitoring well MW-3 was pumped out with a vac-truck on a weekly basis for six weeks during May and June of 1999. A total of 125 gallons of a waste gasoline and water mixture were pumped out and transported off site for disposal. Despite the well pump outs, concentrations of gasoline related compounds in MW-3 did not decrease as expected.

A **RAM Completion Report**, dated June 16, 1999, was submitted to the MassDEP, detailing the results of the aquifer pump test performed on monitoring wells, MW-7 and MW-8. Since MW-8 did not recharge sufficiently, the pump test was performed on MW-7 only. It was concluded that MW-8 was hydraulically connected to MW-7. It did not appear that the other wells were hydraulically connected to MW-7.

An **IRA Status Report** was submitted on March 10, 2000. The IRA Status Report indicated that SPH levels in monitoring well MW-3 been reported as non-detectable during the monitoring event on December 15, 1999.

A **Phase II Comprehensive Site Assessment** (CSA), dated August 4, 2000, was submitted to the MassDEP. The Phase II CSA concluded, based on a groundwater model developed by The BIOSCREEN Version 1.3, developed by the Environmental Protection Agency (EPA), that gasoline impacted groundwater is most likely present off-site and downgradient at a distance of approximately 195 feet from the former USTs. Also, soil in the area near the former fuel oil UST is still impacted.

A **Phase III Remedial Action Plan** (RAP), dated September 13, 2000, was submitted to the MassDEP. The Phase III RAP indicated that bioremediation was the selected alternative to remediate the gasoline-impacted groundwater and soil excavation was the selected alternative to remediate the oil-impacted soil.

On October 22, 2001, a **Phase IV Remedy Implementation Plan** (RIP) was submitted to the MassDEP. Due to the multiple sources of oil and hazardous materials (OHM) at the site, a combination of remedial actions was proposed. Excavation of up to 230 cubic yards of soil was proposed to reduce levels of PAH compounds in the vicinity of the former fuel oil UST. A product recovery system was proposed to reduce levels of NAPL detected in monitoring well MW-10, and bioremediation was proposed after NAPL at the site has been reduced to non-detectable levels.

During April 29, 2002 through May 2, 2002, soil excavation activities were undertaken at the site to remove PAH impacted soil in the rear of the property and to install trenching for an automated NAPL recovery system. Approximately 220 tons of impacted soil was removed from the site and stockpiled on-site. On June 10 and 11, 2002, the soil was transported to American Reclamation Corp. in Charlton, Massachusetts, for recycling.

After removal of the impacted soil at the rear of the property, 9 confirmatory soil samples were collected from the excavation sidewalls and submitted to Geolabs, Inc. of Braintree, Massachusetts, a state certified laboratory, for laboratory analysis of Extractable Petroleum Hydrocarbons (EPH) with target analytes by MassDEP Method EPH. Clean backfill material was installed in the excavation area to grade.

According to the laboratory analytical report, numerous PAH compounds were encountered in soil samples, S-33, S-36, and S-37 at concentrations above the site's applicable MCP Method 1 Soil Standards.

On May 2, 2002, trenching activities were completed in order to install a conduit to monitoring well MW-10 for the purpose of installing an automated NAPL recovery system. The conduit is used to allow for the installation of plastic tubing that connects a pneumatic pump in monitoring well MW-10 to a compressor that is located behind the on-site building. The pneumatic pump is used to pump NAPL out of the well on an automated basis. Additionally, the horizontal piping that was installed in the ground during the tank replacement project in 1997 was extended to an area behind the on-site building for possible future use. Monitoring well MW-3 was also connected to the horizontal piping so that it could be used as a future remediation well, if necessary.

The NAPL recovery system commenced operation on October 23, 2002. A pneumatic pump and compressor were connected to monitoring well MW-10. Weekly operation and maintenance visits were made on October 29, 2002, November 5, 2002, November 12, 2002, November 18, 2002, November 25, 2002 and December 2, 2002. Subsequently, operation and maintenance visits were changed to monthly. Operation and maintenance visits continued on a monthly basis until the NAPL recovery system was shutdown on August 20, 2004.

Operation and maintenance of the NAPL recovery system included inspection of the system to assure proper operation, measuring the amount of NAPL removed, and gauging of monitoring wells MW-3 and MW-10. The NAPL recovery system was shut down on August 20, 2004 due to continued non-detect readings for product in monitoring well MW-10. On October 18, 2004, a total of 100 gallons of a NAPL/groundwater mixture was removed from two Department of Transportation (DOT) drums located on-site. A total of approximately 265 gallons of NAPL/groundwater mixture has been removed from the site to date.

Phase V OM&M/IRA Status Reports were submitted to the MassDEP detailing activities at the site on September 30, 2003, March 4, 2004, September 24, 2004 and March 7, 2005.

The IRA for RTN 4-13560 was closed with an **IRA Completion Report** on March 7, 2005. A ROS Report with a Substantial Hazard Evaluation (SHE) was submitted on April 7, 2005, with a finding that no substantial hazard exists at the site. In accordance with 310 CMR 40.0893 (2)(e), ROS Reports documenting the monitoring of the site conditions will be submitted to the MassDEP every six months until a level of No Significant Risk is achieved at the site.

Following execution of the access agreement to the offsite property located at 820-826 Washington Street on February 1, 2010, additional assessment activities which included the advancement of four (4) soil borings (SB-102, SB-104, SB-105 and SB-106) and two (2) soil gas points (SG-3 and SG-4) were conducted on March 4, 2010, to potentially support submittal of an RAO. Furthermore, additional parameters were collected from select groundwater monitoring wells to support the potential RAO submittal. In addition, Level 1 Soil Gas screening activities were conducted to evaluate potential vapor migration into onsite and offsite occupied structures.

Based on the additional assessment activities conducted during March 2010 it has been concluded that the Average soil concentrations fall within Method 1 risk assessment standards. Soil Gas Screening activities conducted on SG-1 through SG-4 do not indicate that vapor migration into occupied structures is occurring. However, groundwater concentrations relative to MW-10 and MW-11 from the March 12, 2010 sampling effort do not fall within Method 1 risk assessment standards.

1.0 INTRODUCTION

Tyree Organization, Ltd. (Tyree) has been retained by Getty Properties Corp. (Getty) to conduct environmental activities at the Getty Service Station, located at 825 Washington Street, Stoughton, Massachusetts (herein, referred to as "the property"). As required by the Massachusetts Contingency Plan (MCP), Getty is required to perform a Phase II Comprehensive Site Assessment (CSA) for the site. The scope of work included: a reconnaissance of the property and surrounding area, a survey of the private water wells in the area, the installation of one groundwater monitoring well, and the subsequent soil and groundwater sampling. Additionally, past soil and groundwater monitoring data were reviewed to determine site hydrogeological characteristics, fate and transport of compounds, nature and extent of impact, exposure assessment, and risk characterization. This Phase II CSA was performed in accordance with 310 CMR 40.0835 through 40.0836 of the MCP and Massachusetts General Law (M.G.L.) Chapter 21-E.

2.0 PROPERTY HISTORY

2.1 Current and Past Use and Ownership

The property is located approximately 200 feet south of the intersection of Washington Street and Park Street in Stoughton, Massachusetts. A Site Location Map is included as Figure 1. The property slopes slightly to the south, with an area approximately 0.33 acres in size. A one-story concrete-block building with two service bays is located on the southern portion of the property. The building has an approximate area of approximately 1,900 square feet. A Site Plan is included as Figure 2. The disposal site is defined as the area having documented petroleum impacted soil and/or groundwater. The disposal site boundary is depicted in Figure 3.

The current owner of the property is Joe's Shell, Inc. of Stoughton, MA, who has owned the property since 1976. The site is currently utilized by Getty Properties Corp., who has leased the property since 1990, for gasoline dispensing and automotive repair services. According to records maintained at the Stoughton Building Department, the property has been used as a gasoline station since 1956.

The property is located in an area of mixed commercial and residential use. The property is abutted to the north by a residential dwelling, to the east by Washington Street, to the south by a Veteran's of Foreign Wars (VFW) building, and to the west by a parking lot for a train station. Across Washington Street are commercial properties including a real estate office and a printing business.

2.2 Release History

Tyree was contacted by Getty on January 2, 1996, to respond to a complaint of odors in the basement of the adjacent VFW building located at 837 Washington Street. A Tyree environmental scientist monitored the VFW building, as well as the Getty Station at 825 Washington Street, using a photoionization detector (PID) and an explosion/oxygen meter to detect the presence of volatile organic compound (VOC) vapors. PID readings ranging from 58 parts per million (ppm) to 96 ppm were reported in the VFW basement on the northern side of the building. No explosive or oxygen deficient atmospheres were detected using the explosion/oxygen meter.

Michael Moran of the DEP-Southeast Regional office was notified of the site conditions on January 2, 1996, by Michelle Grenier of the Town of Stoughton Environmental Office. Release Tracking Number (RTN) 4-11868 was assigned to the site. DEP granted verbal approval of an IRA, which consisted of the monitoring of VOC vapors within the VFW building and the implementation of a soil vapor extraction system (SVES). Two vapor extraction wells SVE-1 and SVE-2 were installed on the northern side of the VFW building on January 3, 1996. The SVES was started on January 15, 1996. A 1 horsepower Rotron blower was used for the vacuum source to extract vapors from the subsurface and a 55-gallon vapor phase granular activated carbon drum was used for the treatment of vapors prior to discharge to the atmosphere. Additionally, the IRA consisted of the tightness testing of the underground storage tanks (USTs) at the Getty Station. An IRA Plan was submitted to the DEP outlining the conditions which were previously verbally approved.

An IRA Status Report dated April 24, 1996, was submitted to the DEP detailing the monitoring results of the SVES and the vapor levels in the VFW building. The USTs and associated piping at the Getty Station were tested for tank tightness and were found to be tight. In order to determine the source of the VOC vapors in the VFW building, five soil borings were installed in the area between the Getty Station and the VFW. Results of the soil sampling did not indicate the presence of VOCs in soil.

An IRA Completion Report, dated October 28, 1996, was submitted to the DEP detailing the results of the VOC vapor monitoring program. The IRA Completion Report concluded that VOC vapors were not detected in the VFW building with the SVES off for a period of four months. Therefore, it was determined that an IRA was longer required at the site.

A Response Action Outcome (RAO), dated December 11, 1996, was submitted to the DEP. The RAO concluded that a level of "No Significant Risk", as defined by the MCP, had been documented as being attained at the site and that the conditions of a Class A-1 RAO were met. The RAO also documented that attempts to identify the source of the vapors through the advancement of soil borings in the area between the Getty Station and the VFW building were unsuccessful.

Tyree was contacted by Mr. Roy Lupino, an official of the VFW, late in the day on January 27, 1997, to respond to a subsequent complaint of organic odors in the VFW building. Mr. Roy Lupino stated that the organic odor was encountered in the morning when an office door in the basement was opened, but the odor very quickly dissipated to a non-detectable level. A Tyree environmental scientist assessed the VFW building, as well as the Getty Service Station, early in the morning on January 28, 1997. Using a PID and explosion/oxygen meter, air in the first floor, basement, outside the VFW building, and inside the Getty Service Station, was monitored for VOC vapors. The area of the basement on the northern side of the VFW building exhibited a PID reading of 14 ppm. Other areas of the VFW building and the Getty Station were monitored with a PID, but all other PID readings were less than 1 ppm. No explosive or oxygen deficient atmospheres were detected using the explosion/oxygen meter. During the inspection of the property, there was no visual evidence of petroleum staining on the pavement. Also, there were no catchbasins located near the VFW building or the Getty Service Station.

The purpose of the January 28, 1997, assessment was to determine if an imminent hazard existed and if a notifiable release had occurred in accordance with the Massachusetts Contingency Plan (MCP). Based on the results of the investigation which established that there was no imminent hazard, it was the opinion of the LSP-of-Record for the site that no reportable release, as defined by the MCP, had occurred.

Based on the knowledge that the vapor release was not a one time occurrence, as initially thought based on the lack of success in identifying any potential sources, Getty and the LSP-of-Record decided to initiate a more extensive investigation of possible contamination sources. As a voluntary precautionary measure, it was decided to reactivate the on-site SVE system.

On February 12, 1997, the two existing vapor extraction wells on the southern side of the Getty station were reconnected to the SVES. The SVES was installed to maintain non-hazardous conditions at the site until the source of the vapors could be found. A 1 horsepower Rotron blower is used to extract vapors from the vadose zone. One 55-gallon drum of granular activated carbon (GAC) was used to treat the vapors prior to discharge to the atmosphere.

In discussions with Getty, there was a question as to how to define the ongoing remediation activities at the site in accordance with the MCP. A telephone conversation was held with Mr. Robert Kearns of the DEP Southeast Regional Office and it was determined by the DEP that a new release notification should be made. Mr. Kearns was verbally notified of the new release conditions and verbal approval of an IRA was granted on April 4, 1997. The Release Notification Form and IRA Plan was submitted on May 28, 1997. RTN 4-12937 was assigned to the site.

On September 24, 1997, Tyree excavated and removed five USTs from the site. The USTs consisted of one 8,000-gallon gasoline UST, two 4,000-gallon gasoline USTs, one 4,000-gallon diesel UST, and one 550-gallon fuel oil UST. A 550-gallon waste oil UST was abandoned in place with a concrete slurry due to its proximity to the building foundation. One of the 4,000-gallon USTs was made of fiberglass construction, while the other 4 USTs were made of steel construction. No holes were reported in the USTs during removal. During the tank removals, the septic system was removed. The site was later connected to the town sewer system.

During tank removal activities, excavated soil was monitored with a PID. During the removal of the 4,000-gallon gasoline UST and the diesel UST, PID readings of greater than 200 ppm were reported. Due to the site already being listed due to a release of gasoline, a new notification was not made. As documented in the IRA Completion Report submitted to the DEP on February 13, 1998, approximately 921 tons of soil were excavated and later removed from the site for recycling. Also, the IRA Completion Report indicated that Polynuclear Aromatic Hydrocarbons (PAHs) were detected in confirmatory soil samples which exceeded the reportable concentrations for soil classified as RCS-1. Therefore, a Release Notification Form was submitted to the DEP on February 13, 1998, for the 120-day reporting condition. RTN 4-13682 was assigned to the release.

On November 20, 1997, three bedrock monitoring wells, MW-3, MW-4, and MW-5, were installed on-site. During a groundwater gauging event on December 17, 1997, separate phase hydrocarbons (SPH) were reported in well MW-3, at a thickness of 0.92 feet. Mr. Robert Kearns of the DEP was notified of the 72-hour reporting condition on December 17, 1997. RTN 4-13560 was assigned to the release and DEP granted verbal approval of an IRA to monitor and bail SPH from on-site wells. An IRA Plan was submitted to the DEP on February 13, 1998, detailing the previously approved IRA.

On April 8, 1998, a Phase I Initial Site Investigation and Tier Classification was submitted to the DEP. The Phase I Report concluded that the site should be tier classified as Tier II and an imminent hazard was not present at the time of tier classification.

On July 14, 1998, an IRA Plan Modification was submitted to the DEP for the installation of four additional bedrock monitoring wells and disposal of drill cuttings and well bailings. On October 12, 1998, an IRA Status Report was submitted to the DEP detailing the status of the site activities. Four bedrock monitoring wells, MW-6, MW-7, MW-8 and MW-9, were installed at the property. The IRA Status Report indicated that monitoring of the new wells would continue on a weekly basis.

On December 16, 1998, a RAM Plan was submitted to the DEP for the proposed aquifer pump test on monitoring well MW-8. The RAM Plan was approved by DEP in a letter dated March 8, 1999.

On April 8, 1999, an IRA Status Report was submitted to the DEP detailing the groundwater gauging and sampling activities conducted at the site. Groundwater gauging data indicated that SPH was not detected in on-site monitoring wells from January through March 1999.

An IRA Plan Modification, dated April 21, 1999, was submitted to the DEP for the proposed monitoring well pump out using a vac truck. It was proposed that monitoring well MW-3 would be pumped out on a weekly basis using a vac truck. The weekly pump out would continue for a six week period, whereby groundwater samples would be collected to determine its effectiveness. Monitoring well, MW-3 was pumped out with a vac truck on a weekly basis for six weeks during May and June of 1999. A total of 125 gallons of a waste gasoline and water mixture were pumped out and transported off site for disposal. Despite the well pump outs, concentrations of gasoline related compounds in MW-3 did not decrease as expected.

A RAM Completion Report, dated June 16, 1999, was submitted to the DEP, detailing the results of the aquifer pump test performed on monitoring wells, MW-7 and MW-8. Since MW-8 did not recharge sufficiently, the pump test was performed on MW-7 only. It was concluded that MW-8 was hydraulically connected to MW-7. It did not appear that the other wells were hydraulically connected to MW-7.

The latest IRA Status Report was submitted on March 10, 2000. The IRA Status Report indicated that SPH levels in monitoring well MW-3 been reported as non detectable during the monitoring event on December 15, 1999.

3.0 SITE HYDROGEOLOGIC CHARACTERISTICS

3.1 Characterization of Geologic Conditions

On January 25, 1996, Tyree advanced 5 soil borings in the area between the Getty Station and the adjacent VFW building. One soil sample was collected from just above the bedrock interface, which was encountered at depths of 6 to 8 feet. Groundwater was not encountered during drilling operations. The soil above the bedrock layer consisted of coarse sand and gravel. Soil samples, which were not preserved by methanol, were submitted for laboratory analysis of Volatile Organic Compounds (VOCs) by EPA Method 8020. The results of the soil sampling indicated that none of the compounds analyzed for were detected. A summary of the soil analytical data is included in Appendix A and Boring Logs are included in Appendix B.

During September 24 through 25, 1997, soil samples were collected from the site after removal of three gasoline USTs, one diesel UST, one fuel oil UST, and approximately 900 tons of impacted soil. Soil samples were submitted for analysis of VOCs by 8260 (non-methanol preserved), Volatile Petroleum Hydrocarbons (VPH) with target analytes by DEP Method VPH, Extractable Petroleum Hydrocarbons (EPH) with target analytes by DEP Method EPH, and total lead. The results of the soil sampling indicated that none of the compounds were detected at concentrations in excess of the applicable MCP Method 1 soil standards with the exception of the EPH target analyte compounds detected in the vicinity of the fuel oil UST. A summary of the soil analytical results are shown on Table 1 and the laboratory analytical report is included as Appendix I.

On November 20, 1997, three soil borings were advanced and were later converted into groundwater monitoring wells MW-3, MW-4, and MW-5. The soil above the bedrock layer consisted of sand and silt. Groundwater was not encountered in the overburden material, but bedrock was encountered at depths of 4 to 9 feet. The soil borings were advanced until a water bearing fracture was encountered, which was at depths of 18 to 28 feet. A soil sample from just above the bedrock interface was submitted for laboratory analysis of VOCs by EPA Method 8260, PAHs by EPA Method 8270, VPH without target analytes by DEP VPH, and EPH without target analytes by DEP Method EPH. The results of the soil sampling indicated that the none of the compounds that were analyzed for were detected at concentrations in excess of the applicable MCP Method 1 soil standards with the exception of three PAH compounds, benzo(a)anthracene, benzo(b)fluoranthene, and benzo(a)pyrene. A summary of the soil analytical results are shown on Table 1 and the laboratory analytical is included as Appendix I.

During August 18 through August 20, 1998, four soil borings were advanced and were later converted into monitoring wells MW-6, MW-7, MW-8, and MW-9. The soil above the bedrock layer consisted of sand and gravel. Groundwater was not encountered in the overburden material, but bedrock was encountered at depths of 5 to 9 feet. The soil borings were advanced until a water bearing fracture was encountered, which was at depths of 16 to 20 feet. A soil sample from just above the bedrock interface in boring MW-6 was submitted for laboratory analysis of VOCs by EPA Method 8260, PAHs by EPA Method 8270, VPH without target analytes by DEP VPH, and EPH without target analytes by DEP Method EPH. A sample from MW-7, MW-8, and MW-9 was not submitted for laboratory analysis due to the lack of recovery in the split spoon. The results of the soil sampling indicated that the none of the compounds that were analyzed for were detected at concentrations in excess of the applicable MCP Method 1 soil standards. A summary of the soil analytical results are shown on Table 1 and the laboratory analytical is included as Appendix I.

On June 6, 2000, five borings (SB-20, SB-21, SB-22, SB-23, MW-10) were advanced and one of the borings was later converted into monitoring wells MW-10. The location of the soil borings are depicted on Figure 8. The soil above the bedrock layer consisted of sand and gravel. Groundwater was not encountered during drilling activities, but bedrock was encountered at depths of 5 to 9 feet. The soil boring for MW-10 was advanced until a water bearing fracture was encountered, which was at a depth of 19 feet. A soil sample from just above the bedrock interface in all five borings were submitted for laboratory analysis of EPH with target analytes by DEP Method EPH and an extra sample was collected from MW-10 and submitted for analysis of VPH by DEP Method VPH. The results of the soil sampling indicated that PAHs were detected in SB-20, SB-21, and SB-23 at concentrations the exceed the applicable MCP Method 1 soil standards. All other compounds that were analyzed for were not detected at concentrations in excess of the applicable MCP Method 1 soil standards. A summary of the soil analytical results are shown on Table 1 and the laboratory analytical is included as Appendix I. The soil boring logs are included in Appendix B.

A sample from the three soil borings SB-20, SB-21, and SB-23 were also submitted to Severn Trent Laboratories in Billerica, Massachusetts for analysis of wood and coal ash. The laboratory report indicated that wood ash or coal ash was not identified in any of the three samples. A copy of the laboratory analytical report is included in Appendix I.

3.3 Characterization of Hydrogeologic Conditions

3.3.1 Groundwater Gauging Results

Groundwater monitoring wells were gauged on 109 occasions from December 1997 to June 2000. Due to the lack of groundwater in the overburden, all wells monitored are considered bedrock monitoring wells. Depth to groundwater ranged from approximately 11 to 16 feet below grade during this period. During this period, separate phase hydrocarbons (SPH) were detected in monitoring well MW-3 on many occasions, ranging from non detectable levels to 3.35 feet February 11, 1998. SPH was also detected in MW-4 at a thickness of 0.32 feet on March 23, 2000 and in MW-10 on June 21, 2000 at a thickness of 0.04 feet. SPH was not detected in any other well during this period. The most recent groundwater gauging event performed on June 21, 2000, indicates that groundwater flows to the north and east with a hydraulic gradient of 0.05 feet per foot, which is consistent with historical flow patterns. A summary of the most recent gauging event on June 21, 2000 is shown on Table 2. A groundwater contour map of the most recent gauging event conducted on June 21, 2000, is depicted on Figure 6. A summary of historical groundwater gauging data is included as Appendix C.

3.3.2 Seasonal Groundwater Flow Variations

According to groundwater gauging data, groundwater elevations beneath the property fluctuate approximately 4 feet during the year. Groundwater elevations are highest during the later winter/early spring months and are lowest during the fall months. In general, groundwater at the property flows to the north and east. A summary of historical groundwater elevation data is included in Appendix C.

3.3.3 Determination of Hydraulic Conductivity

The hydraulic conductivity of the aquifer underlying the property was estimated based on physical characterization of soil properties presented in the soil boring logs. The boring logs indicate that the soil consists of sand and silt to a depth of approximately 5 feet, where bedrock was encountered. Since groundwater has never been encountered in the overburden, the hydraulic conductivity of groundwater in the bedrock aquifer can be evaluated using Table 5.2-1 of the DEP Publication # WSC-310-91 Standard References for Monitoring Wells. The bedrock material consists of shale and fractured rock which corresponds to an estimated hydraulic conductivity of approximately 10^{-4} gallons per day per square foot (10^{-5} cm/sec), which is relatively low. A copy of the soil boring logs are included as Appendix B.

3.4 Description of the Potential for Flooding

According to the USGS topographic map for the site and surrounding area (Figure 1), the site is located at approximately 72 feet above mean sea level and is at a higher elevation than most of the surrounding area. Additionally, the closest wetlands area is approximately 0.5 miles downgradient of the site. Due to these conditions, the potential for flooding at the site is unlikely.

4.0 ENVIRONMENTAL FATE AND TRANSPORT OF OIL AND/OR HAZARDOUS MATERIALS

The primary compounds of concern consist of gasoline related compounds, such as benzene, toluene, ethylbenzene, xylenes, MTBE, naphthalene, and VPH fractions. By volume, gasoline is generally made up of 1-3% benzene, 10-25% total BTEX, and 10-15% MTBE. EPH fractions and PAH compounds have also been detected in soil and/or groundwater samples in the area of the former fuel oil UST at the site and are considered compounds of concern. Properties such as mobility, stability, volatility, and bioaccumulative potential are evaluated in this section.

4.1 Benzene

Due to its solubility and organic partition coefficient (Koc), benzene is highly soluble and resistant to sorption, as compared to the other BTEX compounds. Koc reflects the tendency of an organic compound to be adsorbed onto the organic fraction of other soils and is generally independent of other soil properties. This value is expressed as the ratio of the amount of a compound adsorbed per unit weight of organic carbon, to the concentration of the compound in solution at equilibrium. Compounds with a high Koc (greater than 1,000 ml/g) may exhibit high sorption potential in soils and are less likely to leach into groundwater. Koc values less than 100 ml/g, such as benzene, suggest that the compound has a higher potential to leach into groundwater and are considered less stable in the environment

The volatility of a compound can be evaluating by reviewing its Henry's Law Constant. The Henry's Law Constant are quite similar for all the BTEX compounds and therefore benzene has an affinity to change from the liquid phase to the vapor phase. With these characteristics, benzene exhibits high volatility, moderate mobility in soil and groundwater, and limited sorption to soils. The potential for bioaccumulation is considered to be relatively low for this compound.

4.2 Toluene

When compared to benzene, toluene is less soluble and has more potential for sorption. Therefore, toluene is less mobile than benzene and is considered more stable, but is still considered highly mobile when compared to the other compounds of concern. Like benzene, toluene is also highly volatile. The potential for bioaccumulation is considered to be relatively low for this compound.

4.3 Ethylbenzene

When compared to the BTEX group, ethylbenzene has a lower water solubility and high sorption potential. Ethylbenzene represents the least mobile and most stable of the BTEX group, but due to its high Henry's Law constant, it is also highly volatile. The potential for bioaccumulation is considered to be relatively low for this compound.

4.4 Xylenes

The characteristics of xylenes are very similar to that of ethylbenzene. Xylenes exhibits low mobility, high sorption potential, and high stability. Consistent with the other BTEX compounds, xylenes are also highly volatile. The potential for bioaccumulation is considered to be relatively low for this compound.

4.5 MTBE

Methyl tert butyl ether (MTBE) is an organic ether used as an oxygenated octane additive and is found in gasoline at approximately 10% by volume. MTBE is a synthetic chemical and commercially produced to be almost 100% pure. MTBE is relatively mobile and unstable in soils, migrating more rapidly to groundwater than the BTEX group. MTBE exhibits a low potential to sorb to soils and due to its low Henry's Law Constant, MTBE does not exhibit a high potential to change from liquid phase to vapor phase in the environment. Also, due to its man-made production, MTBE is resistant to biodegradation. With respect to the other compounds of concern, MTBE is highly mobile and persistent in the environment. The potential for bioaccumulation is considered to be relatively low for this compound.

4.6 Naphthalene

With respect to the BTEX group, naphthalene exhibits low water solubility and high sorption potential. Therefore, naphthalene has low mobility and high stability in the environment. Due to its low Henry's Law Constant, naphthalene has a low affinity to move from the liquid phase to the vapor phase and is therefore less volatile than the BTEX group. The potential for bioaccumulation is considered to be relatively low for this compound.

4.7 VPH fractions

The VPH fractions are generally mobile, slightly soluble in water, volatilize easily, and have relatively low stability. These compounds do exhibit some influence to biodegradation, but are usually dependent on site specific conditions. VPH fractions are not considered persistent and their potential for bioaccumulation is low.

4.8 EPH fractions, PAHs

EPH fractions and the target analytes of 2-methylnaphthalene and fluoranthene are generally hydrophobic with low water solubility and should biodegrade over time. EPH compounds do not generally migrate as readily as VPH compounds and are more stable due to their hydrophobic properties and higher molecular weights. EPH compounds are not considered persistent and their bioaccumulation potential is very low.

5.0 NATURE AND EXTENT OF PETROLEUM IMPACT

As a result of the reported releases of gasoline and fuel oil from the former USTs on the property, monitoring gives emphasis to VOCs, especially benzene, toluene, ethylbenzene, xylenes, and methyl-tertiary butyl ether. Additionally, laboratory analysis for dissolved metals, EDB, VPH, and EPH has been performed for more recent soil and groundwater sampling events.

5.1 Results of Groundwater Analytical Data

Available groundwater monitoring wells were sampled on March 23, 2000. Samples were collected from each well and submitted for laboratory analysis of VPH/EPH with target analytes by DEP Method VPH/EPH, EDB by EPA Method 504, and dissolved RCRA 8 Metals. Results of the laboratory analytical report indicate that gasoline related compounds were detected in many of the monitoring wells, but exceeded the applicable MCP Method 1 Groundwater Standards in MW-3 and MW-4 only. All other compounds

analyzed were not detected in excess of the applicable MCP Method 1 groundwater standards. A summary of the groundwater sampling data from the March 23, 2000 sampling event is shown on Table 3 and the laboratory analytical reports can be found in Appendix I.

Available groundwater monitoring wells were sampled on June 21, 2000. Samples were collected from each well and submitted for laboratory analysis of VPH with target analytes by DEP Method VPH. Results of the laboratory analytical report indicate that gasoline related compounds were detected in many of the monitoring wells, but exceeded the applicable MCP Method 1 Groundwater Standards in MW-3 and MW-10 only. All other compounds analyzed were not detected in excess of the applicable MCP Method 1 groundwater standards. A summary of the groundwater sampling data from the March 23, 2000 sampling event is shown on Table 4 and the laboratory analytical reports can be found in Appendix I. A groundwater elevation and concentration for the June 21, 2000 sampling event is depicted on Figure 6.

Available groundwater monitoring wells were sampled on 12 occasions from December 1997 through June 2000. Groundwater samples collected from the monitoring wells indicate that compound concentrations have remained relatively consistent since sampling began in December 1997. The highest level of impact has been reported in the samples collected from MW-3 and the most recently installed well, MW-10. The summary of historical groundwater analytical data is included as Appendix E.

5.1.1 Horizontal Extent of Impact in Soil and Groundwater

By evaluating the most recent soil analytical data, it is documented that the horizontal extent of impacted soil was present in the immediate area surrounding the former USTs and in all perimeter borings advanced since 1997. The horizontal extent of impacted soil encompasses these soil sample locations. The horizontal extent of impact in soil is depicted on Figure 3 and is referred to as the disposal site boundary.

The determination of the horizontal extent of impacted groundwater is usually performed by installing downgradient wells until the plume is delineated. Due to the high levels of gasoline related compounds near the property boundary (MW-3 and MW-10), off-site access was attempted. An access agreement was delivered to the owners of the property downgradient of the site at 23 Park Street and 830 Washington Street (Lots 252 and 254 on Figure 4). The owner of the property at 23 Park Street did not approve the access agreement and the owner of the property at 830 Washington Street was reportedly out of the country and was not returning for a few months. Attempts to get approval to install the wells on town property were unsuccessful. A street opening permit to install the wells in the road was denied by the town because the town does not allow the installation

of monitoring wells on town property. Therefore, a groundwater model was used to predict the concentrations of the compounds of concern that exceeded the applicable MCP Method 1 Standards (VPH fractions only) downgradient of the site. The model that was used was BIOSCREEN Version 1.3, developed by the Environmental Protection Agency (EPA). The BIOSCREEN model is based on the Domenico analytical transport model. The model was used to predict the dissolve contaminant plume if no engineered controls of further source reduction measures are implemented.

By evaluating the most recent groundwater analytical data, it is documented that impacted groundwater is present on the northeast portion of the property and most elevated in the areas of MW-3 and MW-4. Using the former UST area as the source area with distance equal to zero, the downgradient distances to wells MW-3, MW-4, MW-5, and MW-6 were used to set up the model. The downgradient distances are 20 feet, 60 feet, 80 feet, and 100 feet, respectively. The exposure point concentrations at these locations were used and their values are shown on the data input form. The first set of data refers to the C5-C8 Aliphatics, the second set of data refers to the C9-C12 Aliphatics, and the third set of data refers to the C9-C10 Aromatics. A discussion of the model inputs can be found in the Groundwater Modeling Report, which is included as Appendix G. Using the exposure point concentrations for the VPH fractions in groundwater and the aquifer characteristics, the model predicts that the concentration of the VPH fractions will be less than the applicable MCP Method 1 standard at a distance of approximately 105 feet downgradient of the source area. Additionally, the model predicted that the levels of the VPH fractions would be below laboratory detection limits at a distance of approximately 195 feet from the source area. The distance of 195 feet from the source area, as well as the existing known site concentrations, was defined as the disposal site boundary and is depicted on Figure 3.

5.1.2 Vertical Extent of Gasoline Impact in Groundwater & Soil

The vertical extent of impacted groundwater was determined by evaluating the monitoring wells logs and groundwater gauging data. The deepest monitoring well is approximately 28 feet and the depth to water has been detected at 11 to 16 feet below grade. Therefore, the vertical extent of groundwater impact is defined as the area from the water table, which is present at a depth of approximately 11 feet below grade, to a depth of 28 feet below grade.

The vertical extent of impacted soil was determined by reviewing the well logs from the installation of the monitoring wells. Since bedrock has been encountered at depths from 4 to 8 feet, soil sampling at depth has been limited. PID readings were reported at depths from 5 to 7 feet in MW-3 and MW-5. In the boring with the highest PID reading (MW-3), it was reported that PID readings decreased at a greater depth. Therefore, the vertical extent of impacted soil is estimated as the area from 5 to 7 feet below grade.

5.1.3 Results of Indoor Air Sampling

On April 15, 1996, a 24-hour indoor air sampling study was conducted in the basement of the VFW building where PID readings had previously been detected. The study was done with the SVES in operation and then later with the SVES turned off. Air samples were collected using a tedlar bag and submitted for laboratory analysis of benzene, toluene, ethylbenzene, xylenes, and MTBE by NIOSH Method 1501. Results of the air sampling indicated that none of the compounds analyzed for were detected. A summary of the air sampling data is included in Appendix F and the laboratory analytical report is included in Appendix I.

During September and October 1997, a second indoor air sampling study was conducted in the basement of the VFW building. The air sampling study consisted of collecting a 24-hour air sample on a weekly basis for four weeks. The samples were collected using a summa cannister and submitted for laboratory analysis of VOCs by NIOSH 1501. The results of the air sampling study indicated that many petroleum compounds and many non-petroleum compounds were detected in the samples. Although, it appeared that these compounds were detected at trace levels and at concentrations much lower than the Occupational Safety and Health Act Permissible Exposure Limit (OSHA PEL). A summary of the air sampling data is included in Appendix F and the laboratory analytical report is included in Appendix I.

Based on the air sampling studies performed to date, the detection of the trace levels of the petroleum related compounds are most likely not attributable to any of the reported releases.

5.2 Release Site Definition

Based on the documented extent of petroleum-impacted soil and groundwater at the site and the groundwater modeling conducted, the release site is defined as the northern and eastern portion of the Getty property located at 825 Washington Street and a portion of the adjacent properties across Washington Street (23 Park Ave, 820-826 & 830 Washington Street) in Stoughton, Massachusetts, which is depicted in Figure 3.

6.0 REGULATORY FILE REVIEW

A file review of federal, state, and local environmental records and databases was conducted for the property and surrounding properties to determine possible nearby releases and their impact. An environmental database search conducted by New England DataMap Technology Corporation (NEDTC) of Dedham, Massachusetts was used as the basis of the federal and state file review. A copy of the NEDTC report is included as Appendix J.

6.1 Federal and State File Review

Federal and state files which were reviewed were: MADEP Master List of State Hazardous Waste Sites, Comprehensive Environmental Response, Compensation, and Liability Index System (CERCLIS), Emergency Response Notification System (ERNS), Resource Conservation Recovery Index System (RCRIS), National Priority List (NPL), Solid Waste Landfills (SWL), Registered USTs, and the State Spills List.

6.1.1 MADEP File Review

The MADEP Master List of State Hazardous Waste Sites was reviewed for properties located within 0.25 miles of the subject property.

According to the New England DataMap Report, the subject property is listed on the MADEP List of Hazardous Waste Sites for the release of petroleum, which was described in Section 2.2 of this report. Four other properties, all approximately 0.25 miles from the site, were also listed on the MADEP list.

Site Name: Citgo/Mutual Service Station
724 Washington Street
Stoughton, MA
DEP Site No. 4-0480
Located approximately 0.25 miles north of the subject property.
This site was listed due to a release of gasoline and given LTBI status in 1988. A groundwater treatment system was in operation at the site during 1990-1992 due to the presence of NAPL in overburden groundwater monitoring wells. No bedrock wells were installed on site. In 1996, a RAM was undertaken to implement bioremediation at the site. Response actions are ongoing at the site.

Site Name: Fragas Brothers Market
105 Porter Street
Stoughton, MA
DEP Site No. 4-0791
Located approximately 0.25 miles north of the subject property.
This site was listed as LTBI in 1990. The site is currently under Phase II status.

Site Name: J.F. Corcoran Shoe Co.
2 Canton Street
Stoughton, MA
DEP Site No. 4-0875
Located approximately 0.25 miles northwest of the subject property.
The site was listed as LTBI in 1990 due to the release of petroleum. The site is currently under Phase II status.

Site Name: Former Service Station
990 Washington Street
Stoughton, MA
DEP Site No. 4-0265
Located approximately 0.25 miles south of the subject property.
The site was listed as LTBI in 1987 due to the release of gasoline. A RAO statement was submitted to the DEP in 1994.

6.1.2 CERCLA Sites

According to the database search conducted by NEDTC, there are no properties listed in the CERCLIS database within 0.5 miles of the subject property. The subject property is not included in the CERCLIS database.

6.1.3 ERNS Sites

According to the database search conducted by NEDTC, there are 2 properties within 0.25 miles of the subject property in the ERNS database. The subject property is not included in the ERNS database.

Site Name: NYNEX
862 Washington Street
Stoughton, MA
Case No.: 511346
Located approximately 500 feet south of subject property.
This site was listed in the ERNS database due to a UST replacement in 1996. No other information was available.

Site Name: Not Given
Wyman Street and Washington Street
Stoughton, MA
Case No.: D60146
Located approximately 500 feet north of subject property.
This site was listed in the ERNS database due to a spill of 50 gallons of diesel fuel in 1995. No other information was available.

6.1.4 RCRA Sites

According to the database search conducted by NEDTC, there are 5 properties within 0.25 miles of the subject property in the RCRIS database. The subject property is not included in the RCRIS database.

Site Name: Alpha Chemical Services
46 Morton Street
Stoughton, MA
ID No. MAD051782316
Located approximately 500 feet southwest of the subject property.
This property is listed in the RCRA database for the generation of 100 to 1,000 kilograms of hazardous waste per month.

Site Name: Ruggiero and Son, Inc.
931 Washington Street
Stoughton, MA
ID No. MAD051775047
Located approximately 1,000 feet south of the subject property.
This property is listed in the RCRA database for the generation of less than 100 kilograms of hazardous waste per month.

Site Name: Stoughton Dye House, Inc.
20 Freeman Street
Stoughton, MA
ID No. MAD045913381
Located approximately 500 feet north of the subject property.
This property is listed in the RCRA database for the generation of less than 100 kilograms of hazardous waste per month.

Site Name: Stoughton Town Hall
10 Pearl Street
Stoughton, MA
ID No. MAD075365692
Located approximately 1,000 feet north of the subject property.
This property is listed in the RCRA database for the generation of less than 100 kilograms of hazardous waste per month.

Site Name: Doctor's Office
85 Park Street
Stoughton, MA
ID No. MAD981212103
Located approximately 500 feet east of the subject property.
This property is listed in the RCRA database for the generation of less than 100 kilograms of hazardous waste per month.

6.1.5 NPL Sites

According to the database search conducted by NEDTC, there are no properties identified within 0.5 miles of the subject property that are included in the NPL database. The subject property is not listed in the NPL database.

6.1.6 SWL Sites

According to the database search conducted by NEDTC, there are no properties located within 0.50 miles of the subject property that are included in the SWL database. The subject property is not listed in the SWL database.

6.1.7 Registered UST Sites

According to the database search conducted by NEDTC, there are two properties within 0.25 miles of the subject property in the Registered UST database. The subject property is also listed in the Registered UST database. The description of the USTs at the property is included in Section 2.2 of this report.

Site Name: New England Telephone Co.
862 Washington Street
Stoughton, MA
Facility ID: 0-012647
Located approximately 500 feet south of the subject property.
This site is listed in the Registered UST database for having a 1,000 gallon UST installed in 1976. No other information was available.

Site Name: Ruggiero and Son, Inc.
931 Washington Street
Stoughton, MA
Facility ID: 0-012635
Located approximately 0.25 miles south of the subject property.
This site is listed in the Registered UST database for the removal of a 3,000 gallon gasoline UST. No other information was available.

6.1.8 State Spills List

According to the database search conducted by NEDTC, there were 2 spill incidences since 1980 within 500 feet of the subject property that are included in the State Spills List database. The subject property was listed in the State Spill List database, which was described in Section 2.2 of this report.

Spill Name: Alpha Chemical Services, Inc.
46 Morton Street
Stoughton, MA
Spill ID: 4-11611
Located approximately 500 feet west of the subject property.
This site was listed in the State Spills database for the release of an 72 pounds of an unknown hazardous material in 1995. No further information was available.

Spill Name: Unlisted
35 Walnut Avenue
Stoughton, *MA*
Spill ID: 4-13443
Located approximately 500 feet east of the subject property.
The site was listed in the State Spills database for the release of No. 2 fuel oil during the assessment of the UST in 1997. No further information was available.

7.0 RISK ASSESSMENT

A risk characterization for soil and groundwater was conducted using the MCP Method 1 approach. The Method 1 approach was used because only soil and groundwater impact have been documented at the site and all the compounds of concern have MCP Method 1 Standards. The site is defined in the risk assessment as the location where compounds of concern have been detected above background levels. The site encompasses a portion of the Getty property and a portion of the adjacent properties located across Washington Street, as shown on Figure 3. The risk characterization and results are included in Appendix H.

The risk assessment indicates that a level of "No Significant Risk" has not been achieved at the site.

8.0 CONCLUSIONS

A Phase II CSA was conducted by Tyree in order to determine the extent of the reported release of gasoline and fuel oil. Due to the reported release of gasoline and fuel oil from the former USTs at the site during 1995 and 1997, soil and groundwater beneath the site has been impacted. Petroleum related compounds have not yet been reduced to levels below the applicable MCP Method 1 Standards.

The horizontal extent of petroleum impact has been defined as a portion of the Getty property and a portion of the two adjacent properties across Washington Street. The vertical extent of petroleum impact has been defined as the area immediate below grade where PAH compounds have been detected to a depth of 28 feet where gasoline related compounds have been detected.

A Phase II Comprehensive Site Assessment was completed by Tyree pursuant to 310 CMR 40.0000. Based on the information presented within this report, Tyree concludes that:

1. Subsurface soils, to a depth of 9 feet below grade, has been impacted from the reported release of petroleum occurring in 1995 and 1997.

2. Groundwater beneath the site, to a depth of 28 feet below grade, has been impacted from the reported release of gasoline.

3. Soil and groundwater sampling conducted in June 2000, indicated petroleum impact is still present on the Getty property.

4. Groundwater at the property is classified as GW-3. Groundwater is also classified as GW-2 in some parts of the site.

5. Based on a Method 1 Risk Assessment, a level of "No Significant Risk", pursuant to 310 CMR 40.0973(7) has not been achieved. Additionally, the requirements of a Response Action Outcome pursuant to 310 CMR 40.1000 have not been achieved. Therefore, further response actions pursuant to 310 CMR 40.0840(1)(a) are required at the site. Further response actions are to be conducted using a Phase III Remedial Action Plan. The Phase III Remedial Action Plan shall be submitted within 30 days of this report.

9.0 DISCLAIMER

This report was been prepared for the use of Getty Properties Corp. Reasonable due diligence was exercised by the staff of Tyree Organization, Ltd. in conducting the research and investigations necessary for the development of this report.

Results of future subsurface investigations may result in a modification of the conclusions stated above. The conclusions presented herein are based upon the current regulatory climate and may require revision if future regulatory changes occur. This investigation and the preparation of this report have been conducted in accordance with generally accepted practices. No other warranty, expressed or implied, is made.

Respectfully Submitted,

Tyree Organization, Ltd.

Matthew J. Lyne

RE: Remedy Operation Status Report
Former Getty Station No. 30646
825 Washington Street
Stoughton, Massachusetts
MassDEP RTN 4-12937; 4-13560 & 4-13682

To Whom It May Concern:

On behalf of Getty Properties Corp. (GPC), Tyree is submitting the following Remedy Operation Status (ROS) Report for Former Getty Station No. 30646 located at 825 Washington Street in Stoughton, Massachusetts (the site). The following Report submittal has been prepared pursuant to 310 CMR 40.0893 of the Massachusetts Contingency Plan (MCP).

Please note that GPC is considered the Potentially Responsible Party (PRP) for the disposal site related to Release Tracking Numbers (RTNs) 4-12937, 4-13560 and 4-13682. The Licensed Site Professional (LSP) of record is Mr. Robert Berger (LSP No. 7565). Massachusetts Department of Environmental Protection (MassDEP) Bureau of Waste Site Cleanup (BWSC) Forms (BWSC-108) has been filed via eDEP for the above-referenced location.

Should you have any questions regarding this project or to request copies of the report submittal, please feel free to contact Tyree at (508) 640-0300.

Sincerely,
Tyree

Jeff G Helgerson
Environmental Scientist

Michael Farrell, LSP
Env. Group Manager

cc: Mr. Kevin Shea, Getty Properties Corp.

1.0 INTRODUCTION

On behalf of Getty Properties Corp. (GPC), Tyree is submitting this Remedy Operation Status (ROS) Report for the property located at 825 Washington Street in Stoughton, Massachusetts (the site). Getty is required to submit a ROS Report for the aforementioned site as continual operation, maintenance and/or monitoring of the Comprehensive Remedial Action (CRA) necessary to achieve a Response Action Outcome (RAO) pursuant to 310 CMR 40.1000 of the Massachusetts Contingency Plan (MCP). This ROS Report documents the on-going operation, maintenance, and monitoring activities conducted at the site since the submittal of the October 18, 2011, ROS Status Report.

This report submittal addresses activities conducted at the site between September 30, 2011 and April 1, 2012, along with supporting data that demonstrates the site meets the criteria for ROS. Bureau of Waste Site Cleanup (BWSC) Transmittal Form 108 has been filed concurrently with the submittal of this report via eDEP. A copy of the Getty Limited Agency Agreement is included as **Appendix A**. A Site Location Map and Site Plan are included as **Figures 1 and 2**, respectively. A Summary of Historical Site Information is included as **Appendix B**.

2.0 STATUS OF COMPREHENSIVE RESPONSE AND REMEDIAL ACTIONS

On October 22, 2001, a Phase IV Remedy Implementation Plan (RIP) was submitted to the Massachusetts Department of Environmental Protection (MassDEP). Due to the multiple sources of oil and hazardous materials (OHM) at the site, a combination of remedial actions was proposed which included excavation, enhanced fluid recovery (EFR), product recovery system and bioremediation. Excavation of up to 230 cubic yards of soil was proposed to reduce levels of polycyclic aromatic hydrocarbon (PAH) compounds in the vicinity of the former fuel oil underground storage tank (UST). EFR activities and a product recovery system were proposed to reduce levels of Non-Aqueous Phase Liquid (NAPL) detected in monitoring well MW-10. As a final step to reduce dissolved gasoline-related compounds in groundwater, bioremediation was chosen as the final remedial action.

Between April 29, 2002 and May 2, 2002, soil excavation activities were undertaken at the site to remove PAH impacted soil in the rear of the property and to install trenching for an automated NAPL recovery system. The NAPL recovery system commenced operation on October 23, 2002. A pneumatic pump and compressor were connected to monitoring well MW-10. Operation and maintenance visits continued until the NAPL recovery system was shutdown on August 20, 2004. Because of naturally decreasing concentrations of Volatile Petroleum Hydrocarbons (VPH) in groundwater following the successful removal of the NAPL, bioremediation has not been implemented as a remedial option to date.

The initial ROS submittal, dated April 7, 2005, supported continued groundwater monitoring. In anticipation of possible site closure, additional assessment activities were scheduled in March 2010, which included the advancement of soil borings across the site. Although soil concentrations supported a condition of No Significant Risk, increasing groundwater concentration trends in June and December 2010 delayed RAO submittal.

On July 15, 2010, Tyree submitted a Release Abatement Measure (RAM) Plan to the MassDEP, which described planned activities for the monitoring and management of soils potentially generated as a result of construction activities consisting of the removal of the UST system and associated dispenser and vent piping. On July 20, 2010, Tyree oversaw the removal of one (1) 12,000-gallon double-walled fiberglass gasoline and one (1) 11,000-gallon double-walled fiberglass "split-tank" containing both diesel and gasoline, on behalf of Getty Petroleum Marketing Inc. (GPMI). The two (2) USTs and associated product and vent lines were removed by Getty as gasoline operations are no longer being conducted at the site. Following UST removal activities, a RAM Completion was submitted on October 1, 2010.

During the UST removal activities, soil representative of previous releases was excavated. Confirmatory soil samples collected following UST removal activities will be utilized to support a condition of No Significant Risk for RTN 4-12937.

3.0 SIGNIFICANT MODIFICATIONS AND/OR PROBLEMS NOTED

3.1 DEP Field Audit

On December 7, 2011, Mr. Elliott Jacobs of MASSDEP met with site LSP, Mr. Robert Berger, on the property located at 825 Washington Street in Stoughton, Massachusetts (the project site). Mr. Jacobs was present for the purpose of performing a site inspection as part of a DEP Field Audit. Following the site inspection, Mr. Jacobs requested that Tyree conduct indoor air sampling for volatile organic compounds (VOC's) and air phase hydrocarbons (APH) at the neighboring residence (815 Washington Street). A copy of the DEP Field Audit is included in **Appendix C**.

In response to the conclusions of the DEP Field Audit, Tyree has made several attempts to contact the property owner, Mr. Daniel S. Silva, in hopes of gaining permission to access the residence at 815 Washington Street. Tyree sent an Offsite Access Agreement letter to Mr. Silva on December 16, 2011 and a certified letter containing an Offsite Access Agreement on January 4, 2012. On January 25, 2012, a Tyree representative conducted a site visit to personally inquire about gaining access to the residence. While on site, the Tyree representative observed that the rental units within the residence were occupied; however Mr. Silva's unit appeared unoccupied and unclaimed mail was observed. Consequently, on January 30, 2012, Tyree received a notice that the certified letter had been unclaimed. Copies of the Offsite Access Agreement letters are included in **Appendix D**. In response to not being able to reach the property owner, Tyree notified Mr. Jacobs via email on January 4, 2012 and January 30, 2012 of the efforts to contact Mr. Silva. Copies of the email correspondences with Mr. Jacobs are included in **Appendix E**. Tyree subsequently obtained additional contact information for the property owner and was able to get in contact with Mr. Silva. Tyree prepared an access agreement letter for the property owner, Mr. Daniel S. Silva, to gain permission to access the residence at 815 Washington Street. On March 29, 2012, Mr. Silva signed the access agreement. A copy of the offsite access agreement is included in **Appendix F**.

3.2 Property Transfer

The site, 825 Washington Street, is currently undergoing a property transfer. As a result, Goldman Environmental Consultants, Inc. (GEC) conducted an ASTM Phase I Environmental

Site Assessment and issued a report dated February 16, 2012. GEC recommended a peer review of Tyree's MCP response actions, a subsurface investigation, removal of the onsite in-ground lifts, a physical investigation of a capped pipe and vent pipe located on property, ground penetrating radar (GPR) survey and testing of building materials. A copy of GEC's Phase I Environmental Site Assessment is included in **Appendix G**.

4.0 REMEDIATION WASTE, REMEDIAL WASTEWATER AND/OR REMEDIAL ADDITIVES

No remediation waste, remedial wastewater and/or remedial additives were generated or used during this monitoring period.

5.0 MONITORING DATA

5.1 Monitoring Well Gauging

Prior to collecting groundwater samples, depth-to-groundwater was measured utilizing an interface probe (IP). This probe was also used to assess if NAPL was encountered in any of the monitoring wells. NAPL was not detected (ND) in any of the on-site monitoring wells. After a Tyree representative recorded the fluid level in each groundwater monitoring well, the probe was decontaminated by rinsing the probe with water, liquinox and methanol.

Depth-to-groundwater ranged from 9.83 feet in monitoring well MW-8 to 15.47 feet in monitoring well MW-101 during this monitoring period. The groundwater elevations obtained from the December 8, 2011 groundwater sampling event was used to produce the Groundwater Contour Maps included as **Figure 3**. Based on the Groundwater Contour Maps, apparent groundwater flow is to the east. Groundwater gauging and elevation data for this monitoring period is summarized on **Table 1**.

The hydraulic gradient was calculated to be 0.044 on December 8, 2011. The hydraulic gradient was determined by the difference in groundwater elevations between monitoring wells MW-8 and MW-101 divided by the distance (115 feet) separating both monitoring wells.

5.2 Monitoring Well Sampling and Analytical Results

Groundwater monitoring events have previously been conducted both quarterly and annually to evaluate groundwater conditions. During each groundwater monitoring event, after calculating the volume of water to be removed from each monitoring well, a 1.5-inch disposable bailer was used to purge approximately three (3) to five (5) well volumes from each monitoring well.

On December 8, 2011, groundwater samples were collected from selected monitoring wells. Groundwater samples were submitted under standard chain-of-custody procedures to Accutest Laboratories of New England located in Marlborough, Massachusetts, a state certified laboratory facility (M-MA136), for analysis of volatile petroleum hydrocarbons (VPH) with target analytes, extractable petroleum hydrocarbons (EPH) with target PAH's, and ethanol. Laboratory analytical results reported the following concentrations above applicable Method 1 GW-2 and/or GW-3 Groundwater Standards:

- VPH C5-C8 aliphatics, VPH C9-C10 aromatics and EPH C9-C18 aliphatics collected from MW-10.

A summary of groundwater analytical results have been included as **Table 2** (VPH) and **Table 3** (EPH). Ethanol was not detected in samples collected from MW-3, MW-4 and MW-8. A copy of the December 8, 2011, Groundwater Laboratory Analytical Report is included as **Appendix H**.

5.3 Soil Gas Screening

On December 8, 2011, what is referred to as Level 1 Soil Gas screening activities in the MassDEP Policy #WSC-02-411, 2002, were conducted by purging soil gas points SG-1 through SG-4 of three (3) well volumes prior to vapor collection in a tedlar® bag. The vapor was then screened using a photoionization detector (PID) equipped with a 10.6 electron volt (eV) lamp and calibrated to an isobutylene response and reported as parts per million by volume (ppmv). Level 1 soil vapor screening results are presented in **Table 4** and compared to Soil Gas PID/FID Screening Levels for Evaluating Indoor Air Impacts (Table 4-9) as outlined in the above guidance document.

Although Level 1 soil vapor screening results have historically been below MassDEP guidance document levels, Level 2 soil vapor sampling activities have been conducted in the past (December 23, 2010), in accordance with MassDEP Policy WSC 02-411 to support a Method 3 Risk Characterization with actual concentrations rather than modeling using Level 1 soil vapor screening values. Results of the Air Phase Petroleum Hydrocarbon (APH) sampling are included in **Table 4** and compared to Soil Gas GC Screening Levels for Evaluating Indoor Air Impacts as outlined in MassDEP guidance documents (MassDEP Policy #WSC-02-411, 2002, Table 4-10). Level 2 soil gas sample results from December 23, 2010, indicate concentrations below applicable Soil Gas GC Screening Levels for Evaluating Indoor Air Impacts as collected from SG-1 through SG-4.

5.4 Monitored Natural Attenuation

Monitoring wells have been identified as either located hydraulically “upgradient/background”, located within the “target” area and/or located hydraulically “downgradient/background” of the dissolved-phase petroleum impacted area. Specifically, monitoring well MW-8 has been considered to represent “upgradient/background” conditions, monitoring wells MW-4, MW-10 and MW-11 have been considered representative of the “target” area and monitoring wells MW-100 and MW-101 have been considered representative of the “downgradient/background” area.

During the December 8, 2011, sampling event, Monitored Natural Attenuation (MNA) field parameters; Dissolved Oxygen (DO), Oxygen Reduction Potential (ORP), temperature, conductivity and pH were collected from monitoring wells MW-8, MW-10, MW-11 and MW-101. MNA laboratory parameters; alkalinity, nitrate, nitrite, sulfate, sulfide, dissolved iron and dissolved manganese were not collected during sampling activities on December 8, 2011. A summary of historic MNA field and laboratory parameters collected has been included as **Table 5**.

6.0 CONCLUSIONS/RECOMMENDATIONS

During this monitoring period, groundwater sampling, laboratory analysis, and Level 1 soil gas screening were conducted at the Site. The results of the sampling and screening were as follows:

- **Groundwater:** VPH and EPH concentrations detected in MW-10 on December 8, 2011 exceed the applicable GW-2 and GW-3 standards;
- **Soil Gas:** Level 1 Soil Gas Screening activities conducted on SG-1 through SG-4 indicated PID readings ranging from 0.0 to 0.4 ppmv, and therefore are less than the Soil Gas PID/FID screening levels. Level 2 Soil Gas Screening activities previously conducted on SG-1 through SG-4 indicated concentrations below applicable Soil Gas GC Screening Levels for Evaluating Indoor Air Impacts.

A vapor point will be installed in the earthen basement floor located at 815 Washington Street. Additionally, an indoor air sample will be collected from the basement, the first floor, and an ambient exterior location for laboratory analysis of Air Phase Petroleum Hydrocarbons (APH). This activity is per the DEP field audit conducted on December 7, 2011 and in regards to the VPH and EPH concentrations above GW-2 standards in groundwater samples collected from MW-10 and MW-11, which are in close proximity to the neighboring residence at 815 Washington Street. Although Level 1 Soil Gas Screening results on SG-1 and SG-2, located on the 815 Washington Street property, do not indicate that vapor migration is occurring at the residence; Tyree will perform indoor air sampling for APH in light of the recent MassDEP Interim Final Vapor Intrusion Guidance (WSC#-11-435).

Due to groundwater concentrations of VPH C5-C8 aliphatics, VPH C9-C10 aromatics and EPH C9-C18 aliphatics above Method 1 GW-2 standards from samples collected from monitoring well MW-10; additional monitoring wells will be installed to delineate the downgradient extent of the groundwater impact. Based upon apparent groundwater flow to the east, additional monitoring wells will be installed downgradient of monitoring well MW-10 within Washington Street (Route 138). If monitoring wells are unable to be placed within Washington Street, Tyree will asses the possibility of installing downgradient monitoring wells at the properties located across the street from the service station at 825 Washington Street (the site).

A permanent solution has not yet been achieved. However, the performance standards for ROS have been met; the site poses No Substantial Hazard, and the original source has been removed and/or controlled. In accordance with 310 CMR 40.0893 (2)(e), ROS Reports documenting the monitoring of site conditions will be submitted to the MassDEP every six (6) months until a level of No Significant Risk is achieved at the Site. The next ROS report will be submitted on or before October 7, 2012, unless conditions support the submittal of an RAO Statement.

7.0 LSP OPINION

In the opinion of Mr. Robert Berger, Licensed Site Professional (LSP) of Record, No. 7565, the current response actions are being performed in accordance with the requirements of 310 CMR 40.0893 of the MCP. The next ROS Report is due in October 2012, unless conditions support the submittal of a RAO Statement.

8.0 PUBLIC NOTIFICATION

Pursuant to 310 CMR 40.1403 of the MCP, public notification is required to Mr. Daniel S. Silva (MW-11, SG-1 and SG-2) for monitoring wells and/or soil gas points located on the 815

Washington Street property which were sampled on both December 8, 2011. A copy of the public notification letter to Mr. Daniel S. Silva has been included as **Appendix I**.

9.0 DISCLAIMER

This ROS Report has been prepared for the use of Getty Properties Corp. (GPC) and/or its designated agents. The staff of Tyree exercised reasonable due diligence during the investigation for and the preparation of this document. The conclusions provided by Tyree in this document are based solely on the information reported in this document. Future site investigative information that was not available to Tyree at the time of this document may result in a modification of the previously stated conclusions. The conclusions presented are based upon the current regulatory climate and may require revision if future regulatory changes occur. This investigation and document have been conducted in accordance with generally accepted practices. No other warranty, expressed or implied is made.

Sincerely,
Tyree

Dear Mr. Crafton:

The purpose of this submittal is to supply the Massachusetts Department of Environmental Protection (MADEP) with a Response Action Outcome (RAO) Statement report package for the above referenced site. This package has been prepared by Cyn Environmental Services (Cyn) on behalf of Quality Beverage to finalize the site's compliance with the Massachusetts Contingency Plan (MCP), 310 CMR 40.0000. This package has been provided as an attachment to an original Release Notification Form (RNF) (BWSC-103) and an original RAO Statement Transmittal Form (BWSC-104). A copy of each is provided in **Appendix A**. Refer to **Figure 1**, the Site Locus, for the regional location of the site, and **Figure 2**, the Site Plan, for site details and other pertinent information.

Information required for an RAO Statement, as specified in Section 310 CMR 40.1056, is contained in this document as a whole. This RAO Statement report package applies only to the January 9, 2003, reported "Sudden Release" of diesel fuel at the referenced site. Additionally, the package only applies to the disposal site as described in section *"I. Disposal Site Definition and Site Activity and Use [Current and Foreseeable]"* of this report, and as referenced in **Figure 2**, the Site Plan.

History

A tractor-trailer combination vehicle operated by Quality Beverage was in the process of making a routine delivery at the 26 Porter Street Pub & Restaurant on January 9, 2003. While exiting the property via alley at approximately 2:45 PM, the diesel fuel storage tank for the refrigeration unit of the trailer struck an existing fire hydrant, puncturing the tank and causing a release of diesel fuel to the snow and ice covered asphalt ground surface of alley. Unaware of the damage/release, the operator continued to exit the vehicle across Porter Street and into the parking lot of the Stoughton, Massachusetts US Post Office, located at 31 Porter Street. Diesel fuel was released to the snow and ice covered asphalt surface of the roadway and the parking lot. Due to the grade of the roadway, diesel fuel also migrated along the road gutter, and into a number of nearby storm drain catch basins. Within the parking lot, the operator of the vehicle observed the release and parked the vehicle back within the alley.

Quality Beverage contacted the Town of Stoughton Fire Department (SFD) and Cyn to respond to the release. The SFD immediately responded and applied absorbent materials to the impacted surface areas and also applied absorbent boom into a number of the basins. Prior to responding, Cyn contacted the MADEP to report the conditions at approximately 3:55 PM on January 9, 2003. Upon reporting, the MADEP determined that the release was or may have been a disposal site as defined in the Massachusetts Contingency Plan (MCP), 310 CMR 40.0000. The MADEP also had reason to believe that Quality Beverage was or may have been a potentially responsible party, based on their status as generator, and issued them a Notice of Responsibility (NOR) pursuant to M.G.L. c. 21E & 310 CMR 40.0000. A copy of the NOR, dated January 17, 2003, and inadvertently referencing Release Tracking Number (RTN) 4-17573, rather than the appropriate RTN, 4-17655, is provided in **Appendix B**.

As indicated in the NOR, general response action requirements included the need for conducting an Immediate Response Action (IRA); the need for hiring a spill cleanup contractor; the need for employing or engaging a Licensed Site Professional (LSP) to manage, supervise, or actually perform necessary response actions; and the need for disposing of all generated wastes in accordance with applicable local, state, and federal regulations. At the time of reporting, Cyn also obtained specific approval from the MADEP to apply absorbent materials to the areas of impact; to collect and containerize impacted snow

and ice; to use a vacuum truck or associated equipment to collect puddles of product and/or pump impacted liquids that may be present in any catch basins; and to containerize and properly dispose of any remediation wastes in accordance with federal, state, and local regulations.

Completed Immediate Response Actions

To comply with the MADEP's requests, Cyn was contracted by Quality Beverage to complete the IRA activities and later, to provide LSP services. It should be noted that additional federal, state, and local permits, unless otherwise noted throughout this report, were not needed to conduct the response actions. All site response actions completed by Cyn were done so in compliance with their health and safety plan, and Cyn's health and safety plan is on file and available for review upon request.

January 9, 2003: Cyn responded to the site and based on a visual inspection of the release area, diesel fuel had been released to the snow and ice covered asphalt surface of the alley, Porter Street in the vicinity of the alley, and to portions of the parking lot across Porter Street. Due to the grade of the area, diesel fuel also migrated westerly along the gutter of the south side of Porter Street, into an ice filled storm drain catch basin located approximately 165 feet from the initial release. Diesel fuel also migrated westerly along the gutter of the north side of Porter Street for approximately 65 feet, and then northerly along the gutter of the east side of Rose Street for approximately 490 feet. At this location, a second ice filled catch basin was impacted.

Mr. Richard LaMothe, LSP of Record for the site, responded and also took part in the visual inspection. It was Mr. LaMothe's opinion that the release had been generally contained to the observed locations. MADEP representative Michael Whiteside had also responded, accompanied the LSP during the inspection, and generally agreed with the LSP's opinion.

Cyn responded with heavy equipment that included a vacuum truck, a skid-steer loader, and an industrial street sweeper. The vacuum truck was used to pump the remaining contents of the diesel fuel storage tank that had been damaged. These actions served to completely eliminate the primary source of the release, and thus, the vehicle left the site for a full repair under its own power. The vacuum truck was also used to skim diesel fuel from the surface of limited standing water within the two subject catch basins (i.e., one within Porter Street and one within Rose Street). According to Cyn's vacuum truck operator, the liquid level within the basins appeared to be below that of any discharge piping prior to pumping. The basins themselves were then completely pumped of their liquid contents. As a precautionary measure, two nearby catch basins were also skimmed due to their location proximate to limited vehicle tracking (i.e., two additional basins within Rose Street, approximately 140 feet from Porter Street). Properly trained personnel then entered the two subject basins and where able, removed all solid material. For the most part, however, the basins were generally filled solid with ice. Removed material was placed into three Department of Transportation (DOT) approved 55-gallon drums. The drums were sealed, labeled, and transported from the site for proper disposal.

Utilizing the skid-steer loader and also by hand methods, Cyn removed all visually impacted snow and ice from the alley, roadway, parking lot, and roadside gutters. All collected material was placed into four DOT approved cubic-yard fiberboard containers. Utilizing the street sweeper, Cyn then swept up all absorbent material applied by the SFD. Cyn applied additional absorbent materials to areas in need, sweeping up this material after working it into the asphalt to remove residual diesel fuel and/or staining. All material was incorporated into the existing containers. The containers were then sealed, labeled, and transported from the site for proper disposal.

January 10, 2003: The LSP returned to the site and completed an inspection to ensure that the previously completed activities were sufficient to remediate the release. While on-site, the impacted asphalt surfaces were inspected and noted to be generally clean and free of diesel fuel. A majority of the asphalt surfaces appeared competent with no large voids or cracks that would have allowed the diesel fuel to migrate to subsurface media (i.e., soil and/or groundwater). A small pothole (less than approximately 2 feet in diameter) and some smaller voids and cracks were present within the alley. However, upon investigating the pothole and voids/cracks, it was found that there were multiple layers of asphalt and thus, it was Cyn's opinion that the diesel fuel was contained to the asphalt and could not have penetrated to soil or groundwater.

The LSP also inspected the surrounding area. The temperature on this day resulted in snow and ice melt conditions, with significant puddling, particularly with the roadways. The LSP observed a number of petroleum-based sheens within the roadway, likely due to the high volume of vehicular traffic within the area and not due to the release.

January 10 & 14, 2003: On these occasions, a Field Scientist visited the Town of Stoughton Municipal Offices to obtain drainage plans, and then visited the site to inspect the subject storm drain catch basins and to verify the drainage flow. Flood Hazard/Wetlands/Watershed Maps (Sheet 49) were provided by the Town of Stoughton Engineering Office and were reviewed with engineering personnel. Although the maps were not definitive, according to engineering personnel, all catch basins generally within downtown Stoughton discharge to a natural depression approximately 900 feet southwest of the subject site, between Perry, Wyman, and Summer Streets.

The scientist visited the site and observed all four of the affected basins. Each appeared generally competent and clean and free of any signs of diesel fuel or staining, except for a slight petroleum sheen within the one catch basin within Porter Street. However, as observed by the LSP on the previous day, snow and ice melt conditions and a high volume of vehicular traffic within the area likely accounted for the sheen, not potential residual diesel fuel from the release. Although this was the case, the scientist left a length of absorbent boom within the basin in an effort to control/eliminate the condition.

The scientist then visited the natural depression southwest of the subject site in an effort to observe the discharge. According to the scientist, the outflow was inspected and was noted to be clean and free of any signs of diesel fuel, with no petroleum sheens present on the surface of flowing/standing water.

March 13, 2003: On this occasion, a scientist re-visited the site and removed the absorbent boom that was left within the basin within Porter Street. The boom was double-bagged, sealed, and transported from the site for proper disposal. Upon removal, the basin appeared clean and free of any sign of a petroleum sheen on the surface of standing water within the basin. On this occasion, the scientist also re-inspected the natural depression. The depression was inspected at a location accessed by Summer Street. A steady flow of water was observed discharging from the existing culvert which emanates from beneath Perry Street. The discharge flowed steadily to the south along a natural drainage ditch within the depression. The area was inspected and again, appeared clean and free of any signs of diesel fuel or a petroleum sheen on the surface of flowing/standing water.

Management of Remediation Waste

January 9, 2003: An estimated 1,000 pounds (i.e., three drums) and an estimated 6,000 pounds (i.e., four cubic-yard fiber-board containers) of "State Regulated Waste Oily Solids" (solid catch basin materials, oily absorbent material, snow, and ice) was removed from the site and transported to Cyn Oil Corporation, Stoughton, Massachusetts for proper disposal under Uniform Hazardous Waste Manifest MA Q357182.

Additionally, an estimated 283 gallons of "Petroleum Oil, Combustible Liquid" (diesel fuel and liquid catch basin contents) were removed from the site and transported to Cyn Oil Corporation for proper disposal under Uniform Hazardous Waste Manifest MA Q374148.

March 13, 2003: An estimated 25 pounds (i.e., one bag) of absorbent boom were removed from the site and transported to Cyn Oil Corporation for proper disposal under Alternative Straight Bill of Lading. A copy of each manifest and the Alternative Straight Bill of Lading is provided in **Appendix C**.

Disposal Site Characterization

I. Disposal Site Definition and Site Activity and Use [Current and Foreseeable]

As a roadway, the future use of the site is not expected to change. Properties within the release area generally include municipal buildings, commercial establishments, and multi-level residential apartments. Surrounding areas are generally paved for parking/access/egress, with very few grassy or landscaped areas. There are no known nearby institutions or natural resources, and a review of information within the *Massachusetts National Heritage Atlas, 2000-2001 edition*, indicates that the release area was not within a Priority Habitat of Rare Species or an Established Habitat of Rare Wetlands and Certified Vernal Pools. The natural depression/wetland area southwest of the subject release is unnamed and not indicated on any topographic maps reviewed by Cyn.

With respect to the release area itself (i.e., disposal site), Cyn has defined it as including the following areas/structures:

- Snow and ice covered asphalt areas:
  - Rear of Alley (26 Porter Street), 40 feet long by 35 feet wide,
  - Alley (26 Porter Street), 40 feet long by 12 feet wide,
  - Porter Street (adjacent to alley), 30 feet long by 30 feet wide,
  - Parking Area (31 Porter Street), 30 feet long by 30 feet wide,
  - South Side Gutter of Porter Street, 165 feet long by 2 feet wide,
  - North Side Gutter of Porter Street, 65 feet long by 2 feet wide,
  - East Side Gutter of Rose Street, 490 feet long by 2 feet wide,
- Storm drain catch basins:
  - Porter Street basin, 165 feet from release area,
  - Rose Street basin, 490 feet from Porter Street, and
  - two basins, Rose Street, 140 feet from Porter Street.

The release area, and thus the disposal site, as identified, is located in Stoughton, Massachusetts. As noted, the site is operated as a roadway and thus, its future use is anticipated to remain the same. Information collected from the Norwood, Massachusetts USGS Topographical Map indicates that the disposal site is approximately located at Latitude 42°-07'-30" and Longitude 71°-06'-11". **Figure 2** illustrates the RAO disposal site boundaries and other pertinent site features.

II. Contaminants of Concern

The reported release at the disposal site relates to diesel fuel. In accordance with MADEP Publication # WSC-401-91, the most recent version of the MCP, and the *Implementation of MADEP VPH/EPH Approach, Final Draft, June 2001*, to properly evaluate such a release, it is recommended that the assessment activities evaluate the impacted media for residual concentrations of EPH/VPH and target diesel fuel related parameters.

Soil and Groundwater: Based on the circumstances surrounding the release and Cyn's observations, there is no evidence to suggest that soil or groundwater were impacted by this release; hence, it is the opinion of Cyn that Contaminants of Concern do not exist with respect to soil and groundwater.

Asphalt Surfaces and Storm Drain Catch Basins: Based on the response activities conducted following the release, there is currently no evidence to support that remaining diesel fuel exists. As a result, it is the opinion of Cyn that Contaminants of Concern do not exist with respect to the surfaces/basins.

III. Soil and Groundwater Categorization

Although soil was not impacted by this release, site soil can be categorized based on accessibility, and on the frequency and intensity of use for children and adults. Soil within the release area is beneath the roadway and thus, may be classified as potentially accessible (i.e., 0 to 15' paved). Since the release area is operated as a roadway, it is estimated that adults and children would only be present at a low frequency and conduct low intensity activities that do not have the potential to disturb the soil. Based on these criteria, site soil is categorized as S-3.

According to Massachusetts Geographic Information System data; Massachusetts Surface Water Quality Standard documentation; information obtained from the Town of Stoughton Board of Health (Mr. Jamie Conlon, Health Agent); site reconnaissance; a review of the site conditions; and other sources:

- Groundwater at the disposal site **is not** subject to GW-1 criteria since it is located not in, or in close proximity to, an area defined as a *Current* or *Potential Drinking Water Source Area*;

- Although the average annual depth to groundwater at the site may be 15 feet or less, groundwater at the disposal site **is** subject to GW-2 criteria since it is located within 30 feet of an existing occupied building or structure and, therefore, a potential source of vapors to indoor air; and,

- As is the case for all disposal sites, groundwater at the disposal site is a potential source of discharge to surface water bodies and, therefore, **is** subject to GW-3 criteria.

IV. Pathways, and Exposure Point Determination and Concentrations

Pursuant to Section 310 CMR 40.0925, an evaluation of the contaminant conditions was conducted to define potential exposure point pathways. Exposure point pathways are defined, without limitation, as ingestion, inhalation, and/or dermal absorption of impacted media. Based on the site conditions, all diesel fuel oil and resultant remediation wastes were removed from the site. Thus, based on the current and future nature of the defined disposal site, and the fact that no exposure points remain, a direct route of exposure is not present towards children and/or adults.

Soil and Groundwater: Since the released diesel fuel did not impact these media, it is the opinion of Cyn that exposure points do not remain.

Asphalt Surface and Storm Drain Catch Basins: Since the released diesel fuel and associated remediation wastes were removed from this media, it is the opinion of Cyn that exposure points do not remain.

V. Critical Exposure Pathways and Substantial Release Migration Evaluation

Pursuant to Section 310 CMR 40.0414, an evaluation of critical exposure pathways (CEPs) was conducted. CEPs are defined as those routes by which oil and/or hazardous material(s) released at a disposal site are transported, or are likely to be transported, to human receptors via vapor phase emissions into a living or working space of a pre-school, daycare, school, or occupied residential dwelling; or ingestion, dermal absorption or inhalation of measurable concentrations of oil and/or hazardous materials from drinking water supply wells located at and servicing a pre-school, daycare, school, or occupied residential dwelling. Based on observations of the site, it is unlikely that a potential critical exposure pathway existed at the time of the release. Additionally, due to the completed site activities already mentioned, it is the opinion of Cyn that a critical exposure pathway does not currently exist at the site.

Based on the definition of Substantial Release Migration (SRM) found at 310 CMR 40.0006 and observations of the site, it is the opinion of Cyn that a condition of SRM could have existed with respect to a "release that resulted in the discharge of separate-phase oil to surface waters, subsurface structures, or underground utilities or conduits. However, based on the containment and remediation of the released material from the storm drain catch basins, a condition of SRM does not currently exist at the site.

VI. Imminent Hazard Evaluation

Pursuant to Section 310 CMR 40.0426, an imminent hazard evaluation shall be performed as part of an IRA at sites where a release or threat of release could pose an Imminent Hazard to human health, safety, public welfare, or the environment, as described in 310 CMR 40.0321. Based on a review of the criteria, an Imminent Hazard could have existed with respect to a "release to a roadway that endangers public safety". However, based on the containment and remediation of the released material from the asphalt surfaces, an Imminent Hazard does not currently exist at the site.

Release and Disposal Site Summary/Site Model

A sudden release of up to 50 gallons of diesel fuel occurred at the site as a result of damage to a storage tank on the trailer of a combination vehicle. Fuel was released to snow and ice covered asphalt ground surfaces where it became absorbed within the snow and ice, pooled, and/or due to the grade of the area(s), migrated to and impacted a number of storm drain catch basins. Based on the weather conditions and large amounts of ice within the basins, it appears that diesel fuel released to the basins was contained to the structures. The asphalt surfaces and basin structures appeared relatively competent, and thus, based on the site information, it appears that the diesel fuel was contained solely to the indicated media.

The release area was not within or expected to affect any known sensitive areas. Groundwater was not encountered at the site and since it is unlikely that the release impacted groundwater, entrainment of vapors in indoor air is very unlikely. The pumping of the remaining contents of the storage tank and the vehicle leaving the site served to eliminate the primary source of the release. Additionally, the completed remedial activities have served to reduce the secondary source(s) (i.e., impacted media) of the release.

Findings

Pursuant to 310 CMR 40.1036, a Class A-1 RAO applies to the Disposal Site because:

- a Permanent Solution has been achieved; and
- the level of oil and hazardous material in the environment has been reduced to background.

Pursuant to 310 CMR 40.1003(5), a Class A-1 RAO is achieved at sites where the source of contamination that is likely to result in an increase in the concentration of the contamination in an environmental medium is eliminated or controlled. In this case, the leaking storage tank was pumped, thus serving to completely eliminate the source of the release. Additionally, Cyn responded and applied absorbents and containerized and removed all impacted materials. These completed response actions, including the off-site disposal of all remediation wastes, have completely eliminated the source of further contamination at the site.

Pursuant to 310 CMR 40.0960, the risk of harm to safety shall be characterized based on the data collected pursuant to the response action being performed and the site, receptor, and exposure information identified for the site. It shall also be characterized by comparing current and reasonably foreseeable conditions at the disposal site and in the surrounding environment to applicable safety standards. Additionally, a level of no significant risk to safety exists or has been achieved if the conditions at the disposal site that are related to the release of oil and/or hazardous material do not currently and will not in the foreseeable future pose a threat of physical harm or bodily injury to people.

In this case, all released diesel fuel and associated remediation wastes have been removed from the site so that contaminants of concern, and thus exposure points, do not exist (i.e., background conditions have been met). Since background conditions have been met and the site currently exists as is did prior to the release, a level of no significant risk to safety exists at the site.

In conclusion, a Class A-1 outcome has been achieved and no further action is required at the defined disposal site with respect to this release. Copies of public notification letters to the Town of Stoughton and Chief Municipal Officer and Board of Health, as required pursuant to 310 CMR 1403(3), are provided in **Appendix D**. Should you require additional information or have any questions relative to this submittal, please feel free to contact either of the undersigned at your convenience.

Sincerely,
Cyn Environmental Services

RESPONSE ACTION OUTCOME (RAO) STATEMENT

Pursuant to 310 CMR 40.0580 (Subpart E) & 40.1056 (Subpart J)

Release Tracking Number
4 - 18968

A. SITE LOCATION:

1. Site Name/Location Aid: Former Sunoco Gasoline Station

2. Street Address: 990 Washington Street

3. City/Town: Stoughton 4. ZIP Code: 02150-0000

☐ 5. Check here if a Tier Classification Submittal has been provided to DEP for this disposal site.
☐ a. Tier 1A ☐ b. Tier 1B ☐ c. Tier 1C ☐ d. Tier 2

6. If a Tier I Permit has been issued, provide Permit Number: _____

B. THIS FORM IS BEING USED TO: (check all that apply)

1. List Submittal Date of RAO Statement (if previously submitted): _____ mm/dd/yyyy

☑ 2. Submit a **Response Action Outcome (RAO) Statement**

☑ a. Check here if this RAO Statement covers additional Release Tracking Numbers (RTNs). RTNs that have been previously linked to a Primary Tier Classified RTN do not need to be listed here.

b. Provide additional Release Tracking Number(s) covered by this RAO Statement. 4 - 18650 ☐ - _____

☐ 3. Submit a **Revised Response Action Outcome Statement**

☐ a. Check here if this Revised RAO Statement covers additional Release Tracking Numbers (RTNs), not listed on the RAO Statement or previously submitted Revised RAO Statements . RTNs that have been previously linked to a Primary Tier Classified RTN do not need to be listed here.

b. Provide additional Release Tracking Number(s) covered by this RAO Statement. ☐ - _____ ☐ - _____

☐ 4. Submit a **Response Action Outcome Partial (RAO-P) Statement**

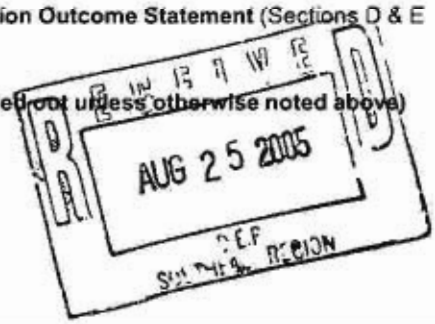
Check above box, if any Response Actions remain to be taken to address conditions associated with this disposal site having the Primary RTN listed in the header section of this transmittal form. This RAO Statement will record only an RAO-Partial Statement for that RTN. A final RAO Statement will need to be submitted that references all RAO-Partial Statements and, if applicable, covers any remaining conditions not covered by the RAO-Partial Statements.

☐ 5. Submit an optional **Phase I Completion Statement** supporting an RAO Statement

☐ 6. Submit a **Periodic Review Opinion evaluating the status of a Temporary Solution** for a Class C RAO Statement (Section E is optional)

☐ 7. Submit a **Retraction** of a previously submitted **Response Action Outcome Statement** (Sections D & E are not required)

(All sections of this transmittal form must be filled out unless otherwise noted above)



Massachusetts Department of Environmental Protection
Bureau of Waste Site Cleanup

Pursuant to 310 CMR 40.0580 (Subpart E) & 40.1056 (Subpart J)

Release Tracking Number
4 - 18968

C. DESCRIPTION OF RESPONSE ACTIONS: (check all that apply, for volumes list cumulative amounts)

- ☐ 1. Assessment and/or Monitoring Only
- ☐ 2. Temporary Covers or Caps
- ☐ 3. Deployment of Absorbent or Containment Materials
- ☐ 4. Temporary Water Supplies
- ☐ 5. Structure Venting System
- ☐ 6. Temporary Evacuation or Relocation of Residents
- ☐ 7. Product or NAPL Recovery
- ☐ 8. Fencing and Sign Posting
- ☐ 9. Groundwater Treatment Systems
- ☐ 10. Soil Vapor Extraction
- ☐ 11. Bioremediation
- ☐ 12. Air Sparging
- ☑ 13. Removal of Contaminated Soils
  - ☐ a. Re-use, Recycling or Treatment
    - ☐ i. On Site — Estimated volume in cubic yards: _____
    - ☑ ii. Off Site — Estimated volume in cubic yards: 57.55
      - iia. Facility Name: MTS — Town: Chichester — State: NH
      - iib. Facility Name: _____ — Town: _____ — State: _____
      - iii. Describe: Asphalt Batch/Cold Mix
  - ☐ b. Landfill
    - ☐ i. Cover — Estimated volume in cubic yards: _____
      - Facility Name: _____ — Town: _____ — State: _____
    - ☐ ii. Disposal — Estimated volume in cubic yards: _____
      - Facility Name: _____ — Town: _____ — State: _____
- ☑ 14. Removal of Drums, Tanks or Containers:
  - a. Describe Quantity and Amount: 3- 8,000 Gallon Steel/Fiberglass Underground Storage Tanks
  - b. Facility Name: James A Grant Inc. — Town: Readville — State: MA
  - c. Facility Name: _____ — Town: _____ — State: _____

C. DESCRIPTION OF RESPONSE ACTIONS (cont.): (check all that apply, for volumes list cumulative amounts)

☐ 15. Removal of Other Contaminated Media:

a. Specify Type and Volume: _____

_____

b. Facility Name: _____ Town: _____ State: _____

c. Facility Name: _____ Town: _____ State: _____

☐ 16. Other Response Actions:

Describe: _____

_____

☐ 17. Use of Innovative Technologies:

Describe: _____

D. RESPONSE ACTION OUTCOME CLASS:

Specify the Class of Response Action Outcome that applies to the disposal site, or site of the Threat of Release.
Select **ONLY** one Class.

☐ **1. Class A-1 RAO**: Specify one of the following:

☐ a. Contamination has been reduced to background levels. ☐ b. A Threat of Release has been eliminated.

☑ **2. Class A-2 RAO:** You **MUST** provide justification that reducing contamination to or approaching background levels is infeasible.

☐ **3. Class A-3 RAO**: You **MUST** provide an implemented Activity and Use Limitation (AUL) and justification that reducing contamination to or approaching background levels is infeasible.

☐ **4. Class A-4 RAO**: You **MUST** provide an implemented AUL, justification that reducing contamination to or approaching background levels is infeasible, and justification that reducing contamination to less than Upper Concentration Limits (UCLs) 15 feet below ground surface or below an engineered barrier is infeasible. If the permanent solution relies upon an engineered barrier, you must also provide a Phase III report justifying the selection of the engineered barrier.

D. RESPONSE ACTION OUTCOME CLASS (cont.):

☐ **5. Class B-1 RAO: Specify one of the following:**

☐ a. Contamination is consistent with background levels ☐ b. Contamination is **NOT** consistent with background levels.

☐ **6. Class B-2 RAO**: You **MUST** provide an implemented AUL.

☐ **7. Class B-3 RAO**: You **MUST** provide an implemented AUL and justification that reducing contamination to less than Upper Concentration Limits (UCLs) 15 feet below ground surface is infeasable.

☐ **8. Class C RAO**:Specify one:

☐ a. Monitoring ☐ b. Passive Operation and Maintenance

☐ c. Active Operation and Maintenance (defined at 310 CMR 40.0006)

E. RESPONSE ACTION OUTCOME INFORMATION:

1. Specify the Risk Characterization Method(s) used to achieve the RAO described above:

☑ a. Method 1 ☐ b. Method 2 ☐ c. Method 3

☐ d. Method Not Applicable-Contamination reduced to or consistent with background, or Threat of Release abated

2. Specify all Soil and Groundwater Categories. More than one Soil Category and more than one Groundwater Category may apply at a Site. Be sure to check off all **APPLICABLE** categories.

a. Soil Category(ies) Applicable:

☐ i. S-1/GW-1 ☐ iv. S-2/GW-1 ☐ vii. S-3/GW-1

☑ ii. S-1/GW-2 ☑ v. S-2/GW-2 ☑ viii. S-3/GW-2

☑ iii. S-1/GW-3 ☑ vi. S-2/GW-3 ☑ ix. S-3/GW-3

b. Groundwater Category(ies) Impacted:

☐ i. GW-1 ☐ ii. GW-2 ☐ iii. GW-3 ☑ iv. No Groundwater Impacted

3. Specify remediation conducted.

☐ a. Check here if soil remediation was conducted.

☐ b. Check here if groundwater remediation was conducted.

4. Estimate the number of acres this RAO Statement applies to: 0.3

F. LSP SIGNATURE AND STAMP:

I attest under the pains and penalties of perjury that I have personally examined and am familiar with this transmittal form, including any and all documents accompanying this submittal. In my professional opinion and judgment based upon application of (i) the standard of care in 309 CMR 4.02(1), (ii) the applicable provisions of 309 CMR 4.02(2) and (3), and 309 CMR4.03(2), and (iii) the provisions of 309 CMR 4.03(3), to the best of my knowledge, information and belief,

> *If Section B indicates that either an **RAO Statement, Phase I Completion Statement and/or Periodic Review Opinion** is being provided,* the response action(s) that is (are) the subject of this submittal (i) has (have) been developed and implemented in accordance with the applicable provisions of M.G.L. c. 21E and 310 CMR 40.0000, (ii) is (are) appropriate and reasonable to accomplish the purposes of such response action(s) as set forth in the applicable provisions of M.G.L. c. 21E and 310 CMR 40.0000, and (iii) comply(ies) with the identified provisions of all orders, permits, and approvals identified in this submittal.

I am aware that significant penalties may result, including, but not limited to, possible fines and imprisonment, if I submit information which I know to be false, inaccurate or materially incomplete.

1. LSP #: 3427

2. First Name: Donald 3. Last Name: Maggioli

4. Telephone: (781) 769-5005 5. Ext.: 6. FAX: (781) 769-9345

7. Signature:

8. Date: 08/24/05
mm/dd/yyyy

9. LSP Stamp:

COMMONWEALTH OF MASSACHUSETTS
DONALD J. MAGGIOLI
No. 3427
REGISTERED PROFESSIONAL ENGINEER

G. PERSON MAKING SUBMITTAL:

1. Check all that apply: ☐ a. change in contact name ☐ b. change of address ☐ c. change in the person undertaking response actions

2. Name of Organization: Sunoco, Inc. (R&M)

3. Contact First Name: William 4. Last Name: Brochu

5. Street: 4 Bellows Road, PO Box 1202 6. Title: Environmental Engineer

7. City/Town: Westborough 8. State: MA 9. ZIP Code: 01581-0000

10. Telephone: (800) 777-6444 11. Ext.: 1357 12. FAX:

H. RELATIONSHIP TO RELEASE OR THREAT OF RELEASE OF PERSON MAKING SUBMITTAL:

☑ 1. RP or PRP ☐ a. Owner ☐ b. Operator ☐ c. Generator ☐ d. Transporter

☑ e. Other RP or PRP Specify: Former Operator

☐ 2. Fiduciary, Secured Lender or Municipality with Exempt Status (as defined by M.G.L. c. 21E, s. 2)

☐ 3. Agency or Public Utility on a Right of Way (as defined by M.G.L. c. 21E, s. 5(j))

☐ 4. Any Other Person Making Submittal Specify Relationship: _____

I. REQUIRED ATTACHMENT AND SUBMITTALS:

☐ 1. Check here if the Response Action(s) on which this opinion is based, if any, are (were) subject to any order(s), permit(s) and/or approval(s) issued by DEP or EPA. If the box is checked, you MUST attach a statement identifying the applicable provisions thereof.

☐ 2. Check here to certify that the Chief Municipal Officer and the Local Board of Health have been notified of the submittal of an RAO Statement that relies on the public way/rail right-of-way exemption from the requirements of an AUL.

☑ 3. Check here to certify that the Chief Municipal Officer and the Local Board of Health have been notified of the submittal of a RAO Statement with instructions on how to obtain a full copy of the report.

☐ 4. Check here to certify that documentation is attached specifying the location of the Site, or the location and boundaries of the Disposal Site subject to this RAO Statement. If submitting an RAO Statement for a PORTION of a Disposal Site, you must document the location and boundaries for both the portion subject to this submittal and, to the extent defined, the entire Disposal Site.

☐ 5. Check here if required to submit one or more AULs. You must submit an AUL Transmittal Form (BWSC113) and a copy of each implemented AUL related to this RAO Statement. Specify the type of AUL(s) below: (required for Class A-3, A-4, B-2, B-3 RAO Statements)

☐ a. Notice of Activity and Use Limitation b. Number of Notices submitted: _____

☐ c. Grant of Environmental Restriction d. Number of Grants submitted: _____

☑ 6. If an RAO Compliance Fee is required for any of the RTNs listed on this transmittal form, check here to certify that an RAO Compliance Fee was submitted to DEP, P. O. Box 4062, Boston, MA 02211.

☐ 7. Check here if any non-updatable information provided on this form is incorrect, e.g. Site Address/Location Aid. Send corrections to the DEP Regional Office.

☑ 8. Check here to certify that the LSP Opinion containing the material facts, data, and other information is attached.

1.0 INTRODUCTION

EnviroTrac Ltd. (EnviroTrac) prepared this Class A-2 Response Action Outcome (RAO) on behalf of Sunoco Inc. (R&M) (Sunoco). This RAO applies to a release of petroleum products at a former Sunoco-branded gasoline retail facility located at 990 Washington Street in Stoughton, Massachusetts and was prepared in accordance with the requirements of the Massachusetts Contingency Plan (MCP) 310 CMR 40.0000. This release is related to the gasoline underground storage tanks (USTs) and dispenser piping located at 990 Washington Street.

For the purpose of this report, the "facility" is defined as the area located within the property boundaries of the former Sunoco-branded gasoline station located at 990 Washington Street in Stoughton, Massachusetts. The "disposal site" is defined as the facility and other properties where oil and/or, hazardous material (OHM) have come to be located as a result of a release at the facility. Based on data collected to date, the disposal site consists of impacted soil located beneath portions of the facility.

In accordance with 310 CMR 40.1036, a Class A-2 RAO shall apply to sites where remedial actions have been conducted at a site, a Permanent Solution has been achieved, the level of oil and hazardous materials in the environment has not been reduced to background, and the implementation of an Activity and Use Limitation is not required to maintain a level of No Significant Risk. In order to achieve a Class A RAO or permanent solution, it must be demonstrated that there is a level of no significant risk for both current and future uses of the site. A Method 1 Risk Characterization was conducted in accordance with the MCP and the Characterizing Risks posed by Petroleum Contaminated Sites: Implementation of the Massachusetts Department of Environmental Protection (MADEP) VPH/EPH Approach, Final Policy, October 31, 2002 (VPH/EPH Approach). The risk characterization was prepared to characterize the risk of harm to health, safety, public welfare and the environment for both current and future uses of the disposal site.

2.0 SITE DESCRIPTION, SENSITIVE RECEPTORS, AND REGULATORY STATUS

2.1 Site Description and Surrounding Properties

The site is identified by the Stoughton Assessor's Office as Map 53, Lot 165 and consists of an irregularly shaped 12,780 square foot parcel of land located on Washington Street near the intersection with Crescent Avenue. Refer to **Figure 1** for the regional location of the site and to **Figure 2** for relevant site features. The parcel is an inactive gasoline filling station. The site is developed with an approximately 250 square foot, single-story, kiosk building. The kiosk is situated in the central portion of the lot with paved, former dispenser islands located to the north and south, and a former gasoline UST pad on the northern portion of the property. Gasoline for retail sale was stored within three 8,000-gallon fiberglass double-walled USTs. The USTs, dispensers, and ancillary piping were removed during Immediate Response Action (IRA) activities associated with RTN 4-18968 and summarized in **Section 3.3**.

The facility was utilized as a gasoline service station since approximately 1925. The entire property is covered with either asphalt or concrete with the exception of small landscaped areas located along the property boundaries.

The facility is located in a mixed commercial/residential area of Stoughton, Massachusetts. Surrounding properties include the following:

North: To the north by several residential properties.

South: To the south by Town-owned wetlands.

East: To the east by Town-owned wetlands.

West: To the west by Washington Street, beyond which are several residential and commercial properties.

The building consists of a steel frame over a concrete slab floor, with masonry exterior walls and a flat tar and gravel roof. The building was heated using forced hot air with a natural gas source. Records at the Stoughton Department of Public Works confirm that the building received potable water from municipal supplies and discharged sanitary wastewater to an onsite septic system located in the northern portion of the site.

General site information to which this RAO applies is presented below.

MADEP Release Tracking Number(s):	4-18650, 4-18968
Potentially Responsible Party and Former site operator:	Sunoco, Inc (R&M) 4 Bellows Road PO Box 1262 Westborough, MA 01581
Client Contact:	Mr. William Brochu, Environmental Engineer, Sunoco, Inc. (R&M)
USGS Quadrangle:	Brockton, Massachusetts
Latitude, longitude:	42° 07' 08" N, 71° 06' 04" W (approximate)
UTM Coordinates:	T19 326,324 E, 4,665,098 N (approximate)
Zoning of facility:	General Business
Zoning of Surrounding	General Business and Residential
Property:	Former Gasoline Service Station
Facility SIC #:	5541 Gasoline Filling Stations, Retail
County:	Norfolk County
Assessor's Information:	Map 53/Plot 165

2.2 Sensitive Receptors

According to the Massachusetts Geographic Information System (MassGIS) maps the nearest surface water body is an unnamed Town-owned wetlands located immediately south and east of the site. An unnamed stream is located approximately 650 feet southwest of the site. Zone II of a public water supply well, an Interim Wellhead Protection Area, a Potentially Productive Aquifer (PPA), or a Zone A of a Class A Surface Water Body. Groundwater in the site vicinity is not utilized for water supply or process water.

According to information in the *Massachusetts Natural Heritage Atlas* (2003 edition) and MassGIS databases, there are no estimated habitats of rare wildlife, areas of critical environmental concern, certified vernal pools, priority sites of rare species habitats, or exemplary natural communities within 500 feet of the disposal site.

No schools, hospitals, childcare centers, or long-term health care facilities are located within 1,000 feet of the disposal site. Several residences located north and northeast of the site have basements. Based on groundwater monitoring data, no concentrations of COCs for the site exceed Method 1 GW-2 standards.

Private wells originally identified as drinking water wells by the Town of Stoughton Board of Health and Public Works Department were determined to be used only for irrigation purposes (i.e. non-potable) based on written confirmation with the property owners. Well information is discussed further in Section **3.2**. Specific information regarding the wells is provided below.

Address	Depth	Approximate Distance to Site	Installation Date	Usage	Sample Date
17 Crescent Avenue	20 Feet	50 Feet (Abuts site)	6/22/1985	Irrigation Only	10/13/2004
980 Washington Street	17 Feet	100 Feet	Unknown	Irrigation Only	11/24/2004
20 Crescent Avenue	Unknown	300 Feet	Prior to 1986	Irrigation Only	Access Not Provided
30 Crescent Avenue	15 Feet	400 Feet	Unknown	Irrigation Only	11/3/2004
42 Crescent Avenue	20 Feet	450 Feet	Prior to 1985	Irrigation Only	11/3/2004

No drinking water wells were identified within 500 feet of the site. Refer to **Figure 3** for the location of private wells within vicinity of the site.

According to MassGIS Maps, there are three areas of critical environmental concern (ACEC) located in the vicinity of the site. The MassGIS Map identifies the unnamed Town-owned wetlands which abuts the site to the south and east, Woods Pond located approximately 1,300 feet to the west, and an unnamed open space located approximately 2,300 feet to the northeast of the site as Areas of Critical Environmental Concern (ACECs). Refer to **Figure 4** for the MassGIS map.

3.0 REGULATORY STATUS AND RESPONSE ACTION HISTORY

3.1 RTN 4-0265

During a Phase I investigation conducted by Kurz Associates, Inc. (Kurz) of West Bridgewater, Massachusetts, elevated concentrations of aromatic hydrocarbon compounds were detected in two site groundwater monitoring wells. The Massachusetts Department of Environmental Quality Engineering (DEQE) issued a Notice of Responsibility (NOR) dated March 11, 1987 to Sure Oil and Chemical Company (Sure), the former site owner, of North Grafton, Massachusetts. As a result of the Phase I findings, MADEP later issued RTN 4-0265.

Following the issuance of the NOR, Sure performed additional assessment of the site. As part of this assessment all USTs located at the site were removed. During a UST excavation on August 12, 1987, gasoline impacted soil was observed at a depth of four to eight feet below grade surface (bgs). Approximately 500 cubic yards of impacted soil was excavated for off-site disposal at Consolidated Waste Service in Maine. During the excavation activities, a petroleum sheen was observed in groundwater pooled at the bottom of the excavation. Approximately 1,100 gallons of groundwater was pumped from the excavation to a vacuum truck prior to backfilling. Additional subsurface investigations included the installation of six soil borings to a maximum depth of 23.5 feet bgs, with all six soil borings completed as groundwater monitoring wells identified at POW-1 through POW-6. Groundwater monitoring wells were sampled for purgeable aromatic compounds on November 24, 1987. Results of groundwater sampling indicated elevated concentrations of benzene, toluene, ethylbenzene and xylenes (BTEX) in POW-1 through POW-6. The highest concentrations of BTEX were detected in POW-1 and POW-3 at 3,270 and 5,870 ug/l, respectively. Kurz recommended additional sampling to confirm impacts and possible limited soil excavation.

On September 1, 1994, Corporate Environmental Advisors, Inc. (CEA) of Worcester, Massachusetts prepared a Response Action Outcome (RAO) Statement and LSP Opinion. This report detailed additional soil and groundwater sampling conducted by CEA. Soil sampling results indicated no concentrations of COCs above Method 1 S-1 soil standards. Groundwater sampling indicated no concentrations of COCs above Method 1 GW-2/GW-3 standards. CEA concluded that the site did not pose a significant risk and submitted a Class A-2 RAO.

3.2 RTN 4-18650

As part of a Phase I/Phase II Environmental Site Assessment (ESA) conducted for real estate considerations, EnviroTrac collected groundwater samples from five previously installed monitoring wells at the property. These wells were redesignated MW-1 through MW-5. Groundwater samples from all monitoring wells were submitted in accordance with chain of custody procedures to New England Testing of North Providence, Rhode Island (NET) for volatile petroleum hydrocarbons (VPH), extractable petroleum hydrocarbons (EPH), volatile organic compounds (VOC) and RCRA 8 metals analyses. During the assessment, EnviroTrac contacted with Mr. James Conlon of the Town of Stoughton Board of Health and Mr. Bill Hammel of the Town of Stoughton Water Department. As part of these discussions Town officials identified five private potable wells located within 500 feet of the site thereby making GW-1 standards applicable.

Analytical results from the August 24, 2004 sampling event documented concentrations of VPH-range analytes in groundwater above applicable Method 1 GW-1 standards in wells MW-1 and

MW-4. EPH-range analytes were detected in groundwater above applicable Method 1 standards in wells MW-3 and MW-4.

The detection of COCs in groundwater monitoring wells MW-1, MW-3 and MW-4 above Method 1 GW-1 Standards within 500 feet of private wells represented a 72-hour reporting condition with the MADEP in accordance with 310 CMR 40.0313(3)(b). Ms. Lori Williamson of the MADEP was informed of the release on August 31, 2004 at 3:55 pm and assigned RTN 4-18650 to the release. MADEP also verbally approved IRA assessment activities to include sampling of nearby drinking water wells. An IRA Plan detailing response activities including site groundwater and residential well sampling was submitted to MADEP on October 22, 2004. EnviroTrac contacted Mr. Conlon of the Board of Health and discussed the 72 hour notification and the plan to sample private wells in the vicinity of the disposal site.

Between October 13, 2004 and November 24 2004 EnviroTrac sampled residential wells located within 500 feet of the site. Groundwater samples were collected from select wells and submitted to NET for EPA Method 524.2 and select Oxygenates analysis which include: methyl tert-butyl ether (MTBE), diisopropyl ether (DIPE), ethylene dibromide (EDB), tert amyl methyl ether (TAME), ethyl tert butyl ether (ETBE), and tert butyl alcohol (TBA). All samples were submitted in accordance with chain of custody procedures to NET. Access was not provided at 20 Crescent Avenue, therefore the well was not sampled. No concentrations of COCs exceeding Method 1 GW-1 standards were detected in groundwater sampled from the residential wells. Due to the location of 20 Crescent Avenue downgradient of wells sampled at 980 Washington Street and 17 Crescent Avenue, and the lack of COCs detected in these wells, it is unlikely COCs are present in the irrigation well located at 20 Crescent Avenue. Refer to **Tables 1 through 6** for a summary of groundwater analytical. A copy of the lab analytical data is included as **Attachment A**.

On November 3, 2004, EnviroTrac sampled on-site site monitoring wells. During the sampling event, all monitoring wells were gauged and sampled. Groundwater samples were submitted to NET for VPH analysis. Groundwater sampled from select wells was also submitted for EPH and VOC analyses. Depth to water (DTW), dissolved oxygen (DO), conductivity, oxidation-reduction potential (ORP), temperature, and pH were measured during the sampling event. No concentrations of COCs exceeding Method 1 GW-2 or GW-3 standards were detected in groundwater sampled from site monitoring wells with the exception of the polycyclic aromatic hydrocarbon (PAH) compound phenanthrene detected above GW-3 standards in well MW-3.

On November 15, 2004, EnviroTrac supervised the installation of soil borings for soil predisposal characterization prior to a planned UST removal. The soil borings were completed by Drilex Environmental of West Boylston, Massachusetts to a maximum explored depth of 12 feet bgs. During installation, an EnviroTrac scientist screened select soil samples with a photoionization detector (PID) in accordance with MADEP jar headspace procedures. Headspace readings ranged from below instrument detection limits (BDL) to a maximum of 86.0 parts per million by volume (ppmv). Predisposal characterization samples were shipped to NET in accordance with chain of custody documentation for analysis of total petroleum hydrocarbons (TPH), VOCs by EPA Method 8260, RCRA-8 metals, polychlorinated biphenyls (PCBs), reactivity, pH, and flashpoint. The results of the analysis indicated that the soil impacts were consistent with gasoline. No concentrations of PCBs were detected, and concentrations of metals were below MADEP published background levels. Only VOCs associated with petroleum compounds were detected. Refer to **Table 10** for a summary of laboratory analytical.

On December 21, 2004, EnviroTrac submitted an IRA Completion Report to the MADEP. The

IRA Completion detailed site activities conducted as part of the IRA Plan and included additional research into potable well usage. EnviroTrac conducted additional research into water usage in the vicinity of the site and prepared questionnaires to each resident with a reported potable wells. Resident responses were received from three residents located within 500 feet of the property and indicated wells at these addresses (17 Crescent Avenue, 20 Crescent Avenue and 30 Crescent Avenue) were used for irrigation purposes only. EnviroTrac performed inspections and sampling of all residences within 500 feet of the site with the exception of 20 Crescent Avenue, which did not provide access. Copies of residential response letters were provided with the IRA Completion Report. Refer to **Attachment A** for copies of residential responses. Due to this additional information Method 1 GW-1 standards do not apply to groundwater at the site. Laboratory analytical data from the most recent sampling event indicated no concentrations of COCs exceeding Method 1 GW-2 or GW-3 standards in groundwater sampled from site monitoring wells with the exception of the polycyclic aromatic hydrocarbon (PAH) compound phenanthrene detected above GW-3 standards in well MW-3 on November 3, 2004.

On February 18, 2005, EnviroTrac submitted a RAM Plan to the MADEP. The RAM Plan was submitted to manage potentially impacted soil and groundwater during the planned removal of the USTs, dispensers, and associated piping.

3.3 RTN 4-18968

On February 23, 2005 Sorco Corporation (Sorco) of Tyngsboro, Massachusetts began the removal of the gasoline USTs, dispensers, and ancillary piping from the facility. During excavation, an EnviroTrac scientist collected soil samples and screened the samples with a calibrated PID in accordance with MADEP jar headspace procedures. On February 23, 2005 PID readings ranging from BDL to 154 ppmv were detected in soil samples collected from the excavation area. On behalf of Sunoco, EnviroTrac contacted Mr. Dan Crafton of MADEP on February 24, 2005 at 2:18 pm to notify MADEP of the 72-hour reporting condition. At the time of reporting, MADEP approved an Immediate Response Action Plan (IRAP) consisting of the removal of the USTs and ancillary piping, the removal and off-site disposal/recycling of up to 750 cubic yards of impacted soil and the removal and disposal of up to 25,000 gallons of water. Mr. Crafton stated that the RAM for RTN 4-18650 was now considered complete and response actions would continue as part of the IRA for RTN 4-18968.

Refer to **Tables 8 through 10** for a summary of the soil analytical data. A copy of the lab analytical data is included as **Attachment B**.

On April 25, 2005, EnviroTrac submitted an IRA Completion Report, a BWSC 106 Release Abatement Measure Transmittal Form detailing the RAM Completion, and a letter detailing the transfer of site investigation from RAM activities to IRA activities. The IRA Completion Report concluded that the condition requiring the IRA, soil exhibiting PID readings greater than 100 ppmv, no longer existed due to the removal of impacted soil. No Imminent Hazard conditions existed or were likely to exist based on data collected to date. No Significant Release Migration (SRM) condition or Critical Exposure Pathways (CEPs) existed at the site.

4.0 REMEDIATION WASTE

Following the completion of the work, 57.55 tons of impacted soil was transported from the site to MTS of Chichester, New Hampshire in accordance with MADEP Bill of Lading (BOL) procedures for asphalt batch recycling on March 4, 2005. Three USTs were removed from the

site and transported to James A. Grant, Inc. on February 24, 2005. The original BOL was submitted to the MADEP on March 3, 2005. No groundwater was removed from the disposal site during completion of IRA activities associated with RTN 4-18968.

5.0 DISPOSAL SITE CHARACTERIZATION

5.1 Soil and Groundwater Categorization

Site soil is categorized based on accessibility and on the frequency and intensity of use for children and adults. Impacted soil at the site is at approximately 4 feet based on a combination of soil sampling and field screening data and is classified as potentially accessible soil (0 to 15' depth, paved surface). This RAO assumes that site use is unrestricted, therefore S-1 standards were used in order to evaluate risk based on potential future residential use. Based on the commercial nature of the property and the zoning of the property as general business, residential development of the site is unlikely. No impacts were detected above Method 3 Upper Concentration Limits (UCLs).

The applicable groundwater categories at the site are GW-2 and GW-3. No private drinking water wells are known to be located within 500 feet of the site, groundwater at the site is not classified as GW-1. Depth to water at the site is less than 15 feet below grade resulting in a GW-2 classification for groundwater within 30 feet of an occupied building, therefore groundwater within MW-3 and MW-4 is classified as GW-2/3 and groundwater within all remaining wells at the site is classified GW-3. Refer to **Figure 5** for the groundwater flow map.

5.2 Definition of Background

As defined in the MCP, 310 CMR 40.0006, background concentrations are defined as those levels of oil and hazardous material that would exist in the absence of the disposal site of concern which are either:

- Ubiquitous and consistently present in the environment and in the vicinity of the disposal site of concern;
- Attributable to coal ash or wood ash associated with fill material;
- Releases to groundwater from a public water supply system; or
- Petroleum residues that are incidental to the normal operation of motor vehicles.

MADEP's, "Technical Update Background Levels of Polycyclic Aromatic Hydrocarbons and Metals in Soil", May 2002 documents anticipated background levels of contaminants in soil. Concentrations of metals were detected at the site. Concentrations of arsenic, chromium, and lead were detected at the site below MADEP documented background concentrations.

5.3 Contaminants of Concern (COCs)

Contaminants detected at the disposal site are limited to petroleum products from the former UST system and dispenser piping and materials previously brought on site as fill. The source of soil and groundwater impacts is limited gasoline releases in the dispenser and UST area. The impacts were confirmed by field screening using the PID instrument in accordance with MADEP jar headspace procedures. Impacted soil was removed based on field screening results. Confirmatory soil sampling was conducted to document soil quality after soil excavation was completed.

Analytical methods for both soil and groundwater samples were selected based on the potential sources and in accordance with the MADEP Characterizing Risks Posed by Petroleum Contaminated Sites: Implementation of the MADEP VPH/EPH Approach Final Policy October 31, 2002 (VPH/EPH Approach) and the most recent version of the MCP. Groundwater and soil at the disposal site was sampled for EPH, VPH, ethylene dibromide (EDB), RCRA-8 Metals, and VOCs by EPA Method 8260. Soil was sampled for VPH, EPH, PCBs, RCRA-8 Metals, VOCs, and TPH.

No concentrations of PCBs or VOCs were detected above laboratory detection limits in soil samples collected. Concentrations of metals detected were below background concentrations established in Technical Update to WSC/ORS #95-141: Background Levels of Polycyclic Aromatic Hydrocarbons and Metals in Soil.

All chemicals detected at a site are considered COCs, unless there is a specific, justifiable rationale for eliminating the contaminant as a COC. Contaminants may be eliminated from the list of study compounds if they are: 1) detected at concentrations at or below background concentrations or by site specific data; 2) laboratory contaminants; or 3) detected infrequently at low concentrations with respect to the detection limit.

Impacted soil was excavated based on field screening using the PID. The following COCs were identified within soil at the disposal site after impacted soil was removed from the excavations:

- VPH C5-C8 Aliphatics
- VPH C9-C12 Aliphatics
- VPH C9-C10 Aromatics
- Toluene
- Xylenes
- MTBE
- EPH C9-C18 Aliphatics
- EPH C19-C36 Aliphatics
- EPH C11-C22 Aromatics
- **Benzo(a)anthracene**
- **Benzo(a)pyrene**
- Benzo(g,h,i)perylene
- Benzo(k)fluoranthene
- Chrysene
- **Dibenzo(a,h,)anthracene**
- Fluoranthene
- Phenanthrene
- Pyrene

COCs detected at concentrations above Method 1 Soil S-1 standards are in **bold**. Impacts to soil are further discussed in **Section 5.4**.

The following COCs were identified in groundwater at the disposal site:

- VPH C5-C8 Aliphatics
- VPH C9-C12 Aliphatics
- VPH C9-C10 Aromatics

- Benzene
- Toluene
- Ethylbenzene
- Xylenes
- MTBE
- EPH C9-C18 Aliphatics
- EPH C19-C36 Aliphatics
- EPH C11-C22 Aromatics
- Benzo(a)pyrene
- Benzo(b)fluoranthrene
- Benzo(k)fluoranthrene
- Benzo(g,h,i)perylene
- Chrysene
- Dibenzo(a,h)anthracene
- Fluoranthene
- 2-Methylnaphthalene
- Naphthalene
- **Phenanthrene**
- Pyrene
- Arsenic
- Barium
- Acetone
- Isopropylbenzene
- n-propylbenzene
- Styrene
- 1,2,4-trimethylbenzene
- 1,3,5-trimethylbenzene

COCs detected at concentrations above Method 1 Groundwater GW-3 standards are in **bold**. Impacts to groundwater are further discussed in **Section 5.5**.

5.4 Soil

Endpoint samples were collected after impacted soil was removed. Impacted soil beneath the disposal site is located at a depth of four feet bgs. PAH impacts to soil are likely attributed to historical fill, however no coal or coal ash was observed, therefore these compounds remain considered as COCs. Since potential future uses of the site are unrestricted, Method 1 S-1 standards were compared to laboratory results. Based on current soil sampling results, *benzo(a)anthracene, benzo(a)pyrene and dibenzo*(a,h)anthracene were detected above Method 1 S-1 standards in dispenser island excavation samples collected from the dispenser area number 2. Benzo(a) anthracene was detected at a concentration of 3.2 milligrams per kilogram (mg/kg), above the S-1 standard of 0.7 mg/kg. Concentrations of benzo(a)pyrene and dibenzo(a,h)anthracene were 3.2 and 3.8 mg/kg, respectively, also above the S-1 standard of 0.7 mg/kg for each.

Exposure Point Concentrations (EPCs) were calculated for the USTs, dispensers and associated piping excavations. In accordance with 310 CMR 40.0926(3)(b)2.a, an arithmetic average was calculated using sidewall and bottom concentrations from the excavation. Arithmetic averages were below Method 1 S-1 standards for all COCs. Specifically, the

arithmetic averages for benzo(a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene were 0.62 mg/kg, 0.62 mg/kg, and 0.69 mg/kg respectively. These values are below the applicable standard of 0.7 mg/kg for all three COCs, respectively. Refer to **Table 11** for a summary of EPCs.

5.5 Groundwater

Groundwater sampling conducted in November 2004 specified no COC concentrations above Method 1 GW-2/3 standards, except for the presence of Phenanthrene in MW-3 above Method 1 GW-3 standards. Groundwater sampling conducted in March 2005 after the UST excavation specified no COC concentrations above applicable Method 1 standards. All EPCs calculated for site groundwater were below Method 1 GW-2 and GW-3 standards. Monitoring well MW-3 provides groundwater data downgradient of the dispensers and monitoring well MW-1 provides groundwater data downgradient of the USTs. Groundwater beneath the site is not used for a current or potential future drinking water supply; therefore GW-1 standards do not apply to the site. Groundwater beneath the facility is located at depths less than 15 feet; therefore GW-2 standards do apply to the facility. Currently, no concentrations of COCs in groundwater at the site exceed GW-2/3 standards.

5.6 Indoor Air

In accordance with the VPH/EPH Approach, impacts to indoor air are not anticipated due to the lack of COC concentrations above Method 1 GW-2 standards.

5.7 Surface Water

Based on the results of groundwater sampling, the disposal site has not impacted surface water. No concentrations of COCs are present above Method 1 GW-3 standards at the disposal site. Therefore impacts to surface water are not expected

5.8 Sediment

Based on the results of soil and groundwater sampling, the disposal site has not impacted sediment. No concentrations of COCs are present above Method 1 GW-3 standards at the disposal site. Therefore impacts to sediment are not expected

6.0 METHOD 1 RISK CHARACTERIZATION

The purpose of this risk characterization is to evaluate and characterize the potential risk to human health, public welfare, safety, and the environment that may be posed by compounds that were detected in groundwater and soil at the site. This risk characterization was completed in accordance with the requirements outlined in the MCP, 310 CMR 40.0900. The risk characterization is based on current and reasonably foreseeable site use and conditions. This risk characterization applies to the disposal site as depicted on **Figure 2**.

6.1 Identification of Current and Reasonably Foreseeable Site Use

The facility is currently vacant but is scheduled to be redeveloped into a gasoline filling station. Due to the zoning of the parcel as industrial and the commercial economic value of the property, exposures to impacted media will remain similar to that of a retail gasoline station. For the

purpose of this risk characterization, future use of the property is expected to remain commercial; however, potential future uses of the site are not restricted and no such restrictions on future use were used in the determination of risk associated with this portion of the facility. Utility upgrade and/or construction involving excavation activities are likely to occur as part of current or future activities. Residential exposures were considered in the risk characterization as a potential future use.

6.2 Applicable Standards

The applicable standards at the site therefore include S-1 for soils and GW-2 and GW-3 for groundwater.

6.3 Potential Receptors and Exposure Potential

6.3.1 Human

Future potential human receptors at the site may include construction workers, site workers, and customers. Workers at the facility are assumed to be adults. Normal operations at the facility may include an average of two to three employees working from eight to 12 hour shifts five days per week. Customers of the facility would be present only for short durations (10 minutes) during automobile refueling. Construction workers could also be present at the site.

As the future use of the facility is unrestricted, future potential human receptors may include residential receptors including adults and children who would be present at the property for 24 hour days.

Exposure point concentrations of impacted soil are below Method 1 S-1 standards. Therefore, COCs in soil are unlikely to pose an exposure potential to human or environmental receptors even if the soil is exposed via excavation. No exposures are expected to on-site workers or infrequent visitors. Dermal, ingestion, and inhalation exposures to current and future human receptors are not expected. There are no private drinking water wells within 500 feet of the disposal site as detailed in **Section 2.2.**

6.3.2 Ecological

Due to the pavement and the commercial nature of the disposal site and vicinity, ecological habitats are limited and exposure to the soil is unlikely. Also due to the exposure point concentration averages below Method 1 S-1 and GW-2/3 standards, COCs in soil and groundwater are also unlikely to pose an exposure to ecological receptors. Ecological receptors do not exist in the vicinity of the site and the migration of COCs with surface water is unlikely.

6.4 Exposure Potential for Future Use

Future use of the property is expected to remain commercial. However, exposure potential was evaluated for all future use scenarios in the risk characterization. Based on the lack of soil impacts above Method 1 S-1 standards ingestion, inhalation, or direct contact are unlikely for all future receptors.

6.5 Identification of Exposure Points

6.5.1 Soil

EPCs were calculated for soil samples collected from sampling locations located inside the USTs, dispenser and piping areas as detailed on **Figure 2**. The EPC area consists of approximately 6,000 square feet of soil at a depth of four to nine feet bgs. None of the COC concentrations detected in any of the EPC data points were more than 100 times the concentration of any other soil data points used in the EPC. All EPCs concentrations are below Method 1 S-1 standards.

6.5.2 Groundwater

EPCs were calculated for COC concentrations in groundwater at the site were below Method 1 GW-2 and GW-3 standards.

6.5.3 Indoor Air

In accordance with the VPH/EPH Approach impacts to indoor air are unlikely as COC concentrations in groundwater are below Method 1 GW-2 standards.

6.6 Potential Impacts to Indoor Air

In accordance with the VPH/EPH Approach impacts to indoor air are unlikely as COC concentrations in groundwater are below Method 1 GW-2 standards.

6.7 Substantial Release Migration, Imminent Hazards, and Critical Exposure Pathways

6.7.1 Critical Exposure Pathways (CEPs)

Vapor Phase Emissions

No pre-schools, daycares or schools were observed in the site vicinity. Residential structures are located 30 feet to the north of the site. Based on existing data, including the depth to groundwater and current concentrations of COCs at the disposal site, vapor phase emissions from this release are unlikely due to the lack of Method 1 GW-2 standard exceedences.

Drinking Water Exposures

Since groundwater in the vicinity is not utilized for potable water supplies, a CEP related to drinking water supply exposures is not present. COCs related to this disposal site have not migrated any drinking water supply areas.

6.7.2 Conditions of Substantial Release Migration (SRM)

Discharges of Separate-Phase Oil and/or Hazardous Materials

No discharges to surface water, subsurface structures or underground utilities or conduits were observed. Discharges of this nature are unlikely based on current data.

Releases to Ground Surface or Vadose Zone Likely to Exacerbate Groundwater Impacts

No releases to the ground surface occurred. EPC concentrations of COCs in soil are currently below S-1 standards. Therefore current vadose zone impacts are not expected to exacerbate groundwater impacts.

Releases That Have or Are Expected to Migrate Greater Than 200 Feet Per Year

COC concentrations in groundwater at the site were below Method 1 GW-2 and GW-3 standards, therefore migration is not likely to occur from the site.

Releases Likely to Be Detected in a Water Supply Within One Year

Based on the distance and direction of the nearest PPA, it is unlikely that the COCs will migrate the 800 feet to the PPA.

Releases Likely to Be Detected in Surface Water, Wetlands, or Public Water Supply Reservoirs Within One Year

There are no COCs above GW-3 standards, therefore the release is not likely to be detected in surface water or wetlands above Method 1 GW-3 standards.

Releases to Groundwater Likely to Result in Vapor Discharges to a School or Residence

Based on groundwater sampling data the release is unlikely to impact these receptors.

6.7.3 Imminent Hazard

No imminent hazards are known to exist at the site. In addition, based on current and historical data from the facility, an imminent hazard is unlikely to exist as a result of this release.

6.8 Characterization of Risk of Harm to Safety

Conditions of risk of harm to safety as defined by the MCP, including conditions that will pose a threat of physical harm or bodily injury to people are not identified on-site. No rusted or corroded drums or containers are located on the site, no weakened berms are present on the site, and no explosive vapors resulting from the release of oil and/or hazardous material were detected on the site. No unsecured pits, ponds, lagoons, or other dangerous structures, or any uncontained materials have been identified on-site for the storage of reactive chemicals. There are no open or on-going excavations at the disposal site and all wastes generated as part of remedial actions were removed from the disposal site. Existing monitoring wells have eight inch or smaller diameter road boxes which are in good repair, bolted, and secured. The maximum well diameter at the disposal site is four inches.

6.9 Characterization of Risk of Harm to the Environment and Public Welfare

Based upon this risk characterization, EnviroTrac determined that a level of no significant risk to human health or the environment exists with respect to the documented release at the site for current site use. Additionally, no restrictions are proposed for future site use. Based upon this risk characterization, an Activity and Use Limitation (AUL) is not required to maintain a level of no significant risk. As the COC concentrations are not reduced to background, a Class A-2 Response Action Outcome statement is appropriate.

No nuisance odors are present at the disposal site. There are no on-going subsurface investigations that would generate dust, debris, or other deleterious visual impacts. The areas of impact are not expected to negatively impact the usefulness of the property.

7.0 FEASIBILITY EVALUATION

As required by 310 CMR 40.860 (e) an evaluation of the feasibility of reducing the concentrations of OHM at the site to levels that achieve or approach background was conducted. The assessment of the threat of release at the site determined no EPCs in the soil or groundwater of COCs above applicable standards, therefore a condition of no significant risk (NSR) exists at the site.

7.1 Feasibility to Approach Background Conditions

As required by the MCP, the feasibility of implementing additional RAAs and/or extending the operation of existing RAAs in order to reduce COC concentrations to background conditions must be considered. EnviroTrac evaluated the feasibility to approach background conditions as part of this Class A-2 RAO as outlined below. This evaluation was conducted in accordance with MADEP policy WSC-04-160, drafted on July 16, 2004, *Conducting Feasibility Evaluations Under the MCP*. This policy outlines MADEP's position related to conditions of categorical feasibility to achieve background conditions, conditions of categorical infeasibility to achieve background conditions and conditions which meet the definition of approaching background.

7.1.1 Conditions of Categorical Feasibility

Conditions of categorical feasibility include site conditions whereby a level of NSR is reached and the remaining impacts are limited to 20 cubic yards or less of petroleum product impacted soil where such soil is:

- Located less than three feet bgs.
- Not covered by pavement or a permanent structure.
- Is not located within a sensitive environment (i.e. wetlands).
- And is not located in an area where soil removal would substantially interrupt public service or threaten public safety.

At this site, EPCs for soil are below applicable Method 1 S-1 standards (as outlined in **Section 6.5.1**.).

7.1.2 Conditions of Categorical Infeasibility

Conditions of categorical infeasibility include the following site conditions:

- Excavation beneath a permanent structure.
- Remedial actions that would substantially interrupt public service or threaten public safety.
- Remediation of degradable non-persistent contaminants.
- Remediation of persistent contaminants located in S-2 and S-3 soils.

At this site, impacted soil is not located beneath a permanent structure. The conduct of further remedial actions would not likely interrupt public service or threaten public safety as impacted media are located on private property. Although the bulk of soil impacts are located in areas currently categorized as S-2 and S-3 areas, the future use of the site is not restricted, therefore, S-1 standards must apply to the impacted soil areas at depths less than 15 feet bgs. Soil at the site is impacted with the COCs outlined in **Section 5.4**. Of these MTBE, benzo(a)pyrene, and benzo(g,h,i)perylene are considered persistent. The remainder of the COCs in soil are considered non-persistent and degradable, therefore additional remediation of these compounds is considered categorically infeasible.

Groundwater at the disposal site is impacted with the COCs outlined in **Section 5.3**. Of these MTBE, benzo(a)pyrene, benzo(g,h,i)perylene, and arsenic are considered persistent. The remainder of the COCs in groundwater are considered non-persistent and degradable, therefore additional remediation of these compounds is considered categorically infeasible.

7.2 Conditions Approaching Background in Soil, Persistent Compounds

The MADEP guidance document defines conditions approaching background in soil in areas classified as S-1 if the concentration of each persistent contaminant at each sampling location is at or below the Method 1 S-1 standards. For this disposal site, all impacted soil area EPCs are below the applicable Method 1 S-1 standard. Therefore, the persistent contaminants in soil meet conditions approaching background.

7.3 Conditions Approaching Background in Groundwater, Persistent Compounds

The MADEP guidance document defines conditions approaching background in groundwater if EPCs of persistent contaminants in groundwater are below ½ the applicable Method 1 groundwater standard. None of the EPCs for persistent contaminants exceed Method 1 standards. EPCs for the persistent contaminants are currently below ½ the applicable Method 1 GW-2 and GW-3 standards. Therefore, the remaining persistent contaminants meet conditions approaching background.

7.4 Feasibility Conclusions

EnviroTrac reviewed site conditions, remedial actions performed to date, and reviewed conditions of categorical feasibility, infeasibility, and conditions approaching background outlined in the MCP guidance document WSC-04-160. Based on these evaluations, the following conclusions are presented:

- Current site conditions meet a condition of NSR, as documented in this Class A-2 RAO and Method 1 risk characterization report.
- Impacted soil at the site contains persistent and non-persistent compounds.
- Impacted groundwater at the site contains persistent and non-persistent compounds.
- Persistent compounds in soil at the site are currently present at concentrations with EPCs below the applicable Method 1 S-1 standard. Therefore, these compounds meet the definition of approaching background. No additional RAA evaluation for the compounds is necessary.
- Persistent compounds in groundwater at the site are currently present at concentrations below the applicable Method 1 GW-2/GW-3 standards. Therefore, these compounds meet the definition of approaching background. No additional RAA evaluation for the compounds is necessary.

8.0 UNCERTAINTY ANALYSIS

This report, the investigations that support it, and the data collected, are subject to uncertainties, which accompany all investigations. The uncertainties are often a result of the limitations of available technology, the feasibility of further investigation, human error, instrument malfunction, weather, unknown subsurface conditions, safety, data interpretation, dated information, and a number of other factors. The scope of investigations at this, and all disposal sites is limited to that necessary to address site conditions based on the levels and nature of contaminants encountered, potential receptors, and the physical characteristics of the site. The limitations on investigations are related to: financial expenditure vs. value of data collected; physical site features (buildings, roadways, utilities); time, and safety concerns during the completion of investigations. No investigation can sample the entire volume of any media (groundwater, soil, air, sediment, or surface water) at a disposal site. The investigations presented in this report were appropriate in scope and magnitude to address the impacts of COCs reported for this release and the potential receptors of the release.

Soil samples were limited to areas of accessible soil. Soil samples could not be collected from buildings, utilities or below the roadways adjacent to the site. Soil samples collected are likely to represent average concentrations across the site.

Groundwater samples are also limited by the same factors limiting soil sampling. Seasonal groundwater level fluctuations should be adequately addressed by the groundwater sampling conducted to date, however, the sampling conducted is not likely to address all potential site conditions.

Analytical data is subject to a multitude of uncertainties related to sample collection, weather, containers, sample handling, contamination (from non-site related sources), instrument variability and error, etc. Quality Assurance/Quality Control (QA/QC) data (surrogate recoveries, matrix spikes, duplicates, and blanks) help to limit uncertainties. QA/QC data provided with laboratory report are reviewed to determine compliance with the method requirements. Data which fails to meet QA/QC requirements is evaluated to determine its usability. The quantity of data collected increases the confidence in the results provided. Repetitive groundwater sampling events increase the certainty of results based on a review of data trends. Sampling events for soil and groundwater by different samplers on different dates and analyzed in different batches at the laboratory serve to counter potential errors by individuals and instrumentation. Review of multiple sites data over years of service with samplers and laboratories helps to identify and eliminate many uncertainties. Anomalies in data trends and poor QA/QC data often necessitate re-sampling to confirm results. While uncertainties do exist in data collection and analysis presented in this and all reports, appropriate conclusions can be formulated with this data.

9.0 FINDINGS AND CONCLUSIONS

Based upon the results of the Method 1 Risk Characterization and previous investigations, the requirements for a Class A-2 RAO are achieved as outlined below:

1. The site is a former Sunoco-branded gasoline station, located at 990 Washington Street in an general business area of Stoughton, Massachusetts. The site is developed with a

single-story, kiosk building constructed of a steel frame over a concrete slab floor with masonry exterior walls.

2. RTN 4-18650 was assigned after the detection of COCs in groundwater monitoring wells above Method 1 GW-1 standards within 500 feet of private wells created a 72-hour reporting condition. RTN 4-18968 was assigned after a 72-hour reporting condition related to a potential release from the USTs and dispenser piping.

3. The disposal site consists of portions of the property located at 990 Washington Street in Stoughton. Specifically, the site consists of soil at depths of approximately four feet to nine feet bgs in the vicinity of the former USTs and dispensers and of groundwater at depths of six to nine feet bgs.

4. The sources of impact at the site were adequately defined as limited releases in the UST and dispenser area. The three USTs, four dispensers and associated piping were removed. Impacted soil was removed based on field screening. The remaining impacted soil is not a continuing source of impact to soil or groundwater. The remaining impacts are attributed to historic fill materials used to develop the site.

5. The nearest PPA is approximately 800 feet southeast upgradient of the site. Based on the distance and location of the nearest PPA, it is unlikely that the COCs will migrate the 800 feet to the PPA.

6. According to data obtained from the Mass GIS, the disposal site does not lie within a Zone II of a public water supply well, an Interim Wellhead Protection Area, a PPA, or a Zone A of a Class A Surface Water Body. Groundwater in the site vicinity is not utilized for water supply or process water.

7. Since the potential future use of the site is unrestricted, Method 1 S-1 standards apply to soil at the site. Based on the results of soil sampling following excavation, no concentrations of COCs exist in soil above Method 1 S-1 standards. None of the COCs detected in soil at the disposal site exceed UCLs or Method 1 S-3 standards.

8. Based upon the results of the Method 1 Risk Characterization, a Condition of No Significant Risk to human health, safety, public welfare and the environment exists for current and future site use scenarios. A condition of No Significant Risk of Harm to human health, public welfare, safety, and the environment was achieved for the site. No remediation waste was removed.

9. EPCs calculated for soil at the site are below Method 1 S-1 standards and EPCs calculated for groundwater at the site are below Method 1 GW-2 and GW-3 standards.

1.0 INTRODUCTION

This Response Action Outcome (RAO) Statement has been prepared by Tetra Tech EC, Inc. (TtEC) for Global Remediation Services, Inc (Global) in response to the Notice of Responsibility (NOR), dated December 2, 2009, issued by the Massachusetts Department of Environmental Protection (MADEP) for the release occurring along approximately a one mile portion of Canton Street in Stoughton, Massachusetts (hereinafter referred to as "the Site" Figure 1). On November 13, 2009, at 3:24 PM, Global notified the MADEP of a release to the environment at this site involving diesel fuel. An unknown quantity of diesel fuel was release to a paved surface due to a mechanical failure within the engine compartment of a Global vehicle. The volume of the release was likely greater than 10 gallons and therefore met the 2-hour notification requirements. A copy of the NOR has been included with this document in Appendix A.

1.1 Responsible Party

The responsible party for this release is:

Global Remediation Services, Inc
700 Richmond St
E. Taunton, MA 02718
Attn: Tim Burbank

The Licensed Site Professional (LSP) of record is:

Lawrence E. Kahrs, LSP #2890
Tetra Tech EC, Inc
133 Federal Street, 6th Floor
Boston, MA 02110

1.2 Description of the Release

The notification and NOR involved release of diesel fuel from a mechanical failure within the engine compartment of a Global vehicle at approximately 3:00 PM on November 13, 2009. The Global vehicle was transporting non-hazardous water to the United Industrial Services facility located at 441 R Canton Street in Stoughton, Massachusetts. Upon entering the access road to the facility, the driver of the vehicle noticed diesel fuel leaking from the engine compartment. The driver immediately turned off the vehicle and used the on-board spill kit on truck to respond to the release. A five-gallon plastic bucket was used to capture any fuel dripping from the engine compartment and absorbent pads were used to absorb fuel on the roadway. It was also at this time the driver noticed fuel stain on the road surface leading from Canton Street into the United Industrial Services facility. The Stoughton Police Department also responded at this time.

The MADEP was verbally notified at 3:24 PM and response activities were initially conducted by the Stoughton Department of Public Works. The Stoughton DPW applied adsorbent material (sand) to the roadway to mitigate the release. Estimated volume of diesel fuel released is approximately 10 to 25 gallons based on interviews with Global staff and observations of the stained area on the pavement. Global personnel also reviewed the truck's route and determined that evidence of the release had originated near the intersection of Washington Street and Porter Street and extended along Canton Street and into the entrance to the United Industrial Services facility.

FIGURE - 1
GLOBAL FUEL RELEASE - STOUGHTON, MA
IMMEDIATE RESPONSE ACTION
VICINITY MAP

FIGURE 1

Source: GOOGLE EARTH

Colantuoni Brothers assisted Global and continued response activities by using a street sweeper to recover the fuel contaminated sand. Two 55 gallon drums of fuel contaminated soil were recovered and later sent to General Chemical Corporation for disposal on December 11, 2009.

Mr. Lawrence E. Kahrs, LSP-of-Record visited the Site at approximately 12:00 PM on November 19, 2009. Mr. Kahrs met with Tim Burbank of Global to review the circumstances of the release and drive the portions of Washington and Canton Streets that were impacted. Mr. Kahrs did not observe any visual evidence of staining on the roadway or impact to the environment at this time.

1.3 Description of Surrounding Area

The area of the release is on the northbound side of RT 27 to the southbound side of Porter Street and continues on the westbound side of Canton Street ending at Mea Terrace (441 R Canton Street, at the United Industrial Services facility). Figure 2 shows the location of the Site and surrounding area. The size of the affected area was estimated to be 0.91miles in length by 6 inches wide. The release was limited to only the traveled way of the Global vehicle and no migration of fuel to the storm sewer system or other utilities was observed.

1.4 Potential Receptors

The Site is a paved surface used exclusively for vehicular traffic. As described above no migration from the roadway to groundwater, storm water or soil occurred during the release or response effort. Stormwater catch basins along the impacted roadway were visually inspected and no migration into these structures was observed. Figure 3 shows the MADEP Priority Resources in the vicinity.

The Site is not located within an existing or potential drinking water source area. The area around the site is serviced by a public water supply and therefore it is assumed that there are no private wells located with in the area of release. For these reasons, category GW-1 does not apply.

There are buildings present within 30 feet of the Site. Therefore, category GW-2 does apply per 310 CMR 40.0932(6) if the ground water depth is 15 ft or less from the spill. The Site is classified as GW-3 due to the potential discharge to surface water.

Receptor Characteristics for the site indicate that the soil is considered potentially accessible due to the paved surface. For this reason and due to the absence of children at the site, category S-1 does not apply. Additionally the only potential human exposure would be to construction workers yielding a low frequency/low intensity adult presence on the site. Therefore soil category S-2 does not apply but category S-3 would be applicable to this release.

An Imminent Hazard evaluation was conducted in accordance with 310 CMR 40.0426 and 40.0950. This evaluation consisted of an assessment of the Site's potential to pose a threat to human health, the environment, safety and public welfare. Based on the quantity of fuel released to the environment, limits of the impacted roadway and the lack of migration observed due to the spill, at no time did this Site present an Imminent Hazard.

Conditions that met the definition of a Substantial Release Migration (SRM) were also assessed, as defined under 310 CMR 40.0413. Based upon the observations summarized above, SRM did not occur at this Site.

Critical Exposure Pathways (CEPs) were also evaluated, as defined under 310 CMR 40.0006. No buildings are present at the site that would allow the migration of vapor-phase emissions or the ingestion, dermal absorption or inhalation of contaminants by human receptors.

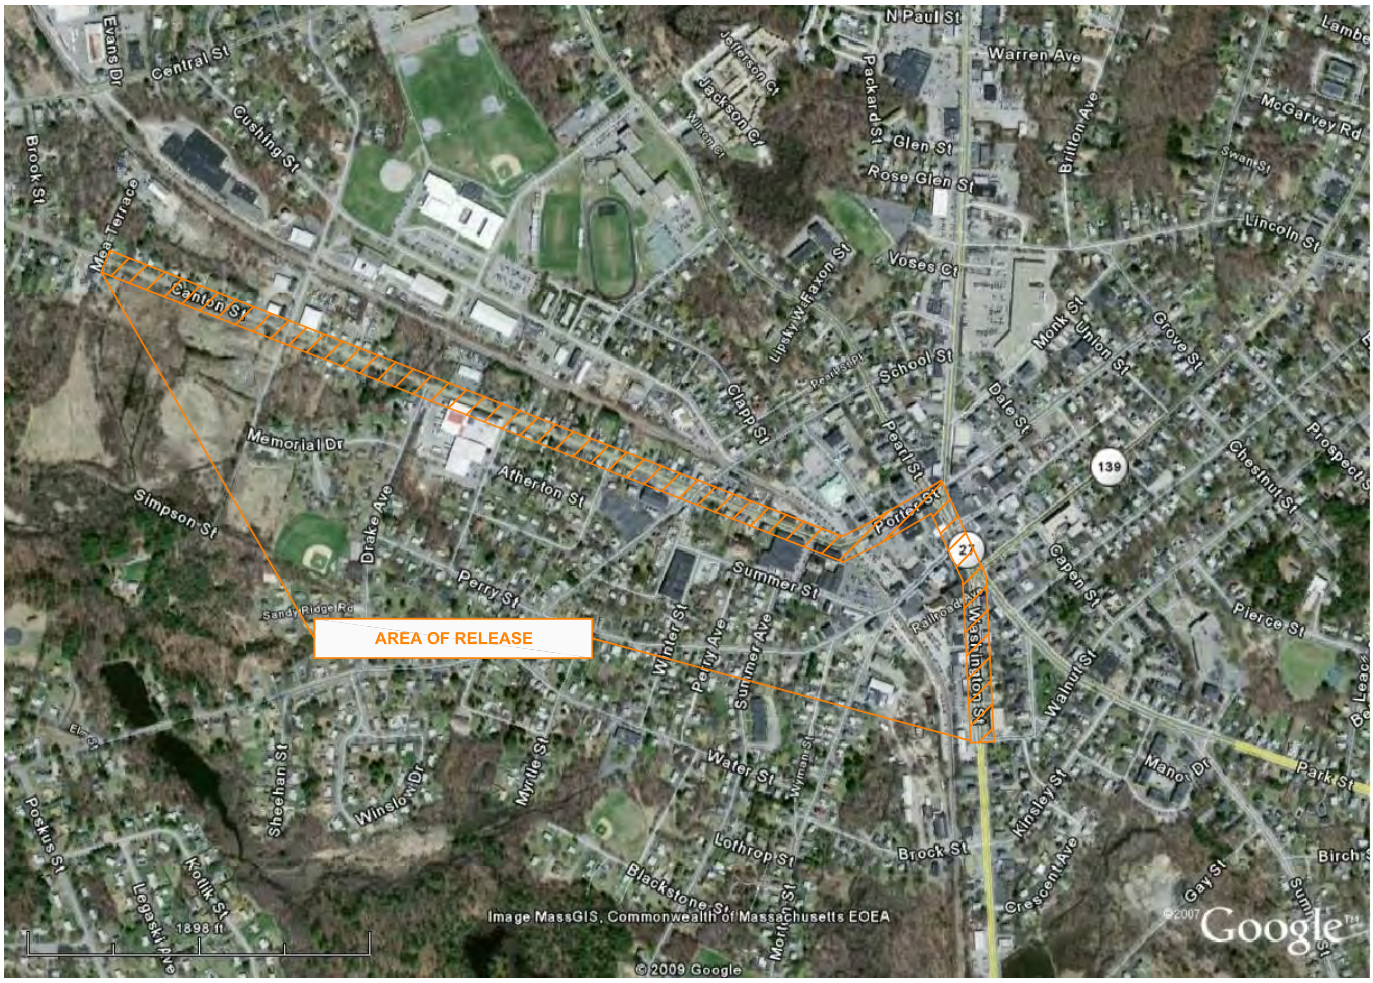
1.5 Applicable Cleanup Criteria

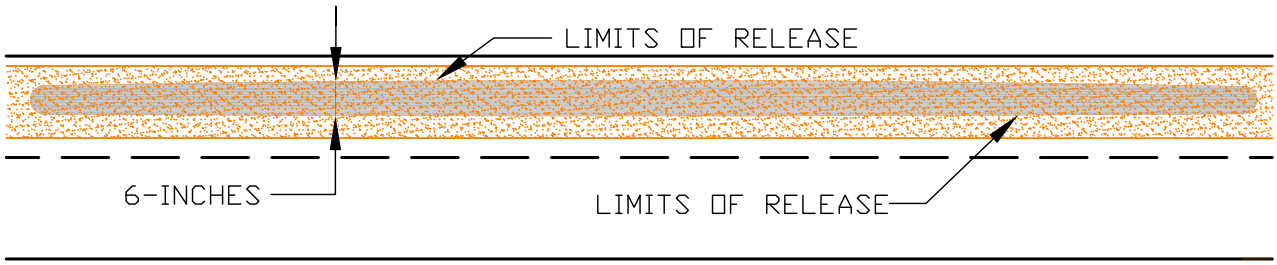
Based upon the information presented above, the applicable cleanup criteria for the Site with S-2/ GW-2&3 has been demonstrated in accordance to regulations imposed by 310 CMR 40.0901(3). Clean up to background levels for the release of a sudden spill confined to the pavement in which the release did not reach soil, groundwater or surface water has been attained with out laboratory data. Demonstration of this has been conducted by means of visual observations, knowledge of the release and a clean up in which the Site has achieved levels of background.

1.6 Class of Response Action Outcome

This RAO Statement presents the data and documentation required to support a Class A-1 RAO for the Site, pursuant to 310 CMR 40.0901(3). A Permanent Solution has been achieved for the Site and no Activity and Use Limitations or on-going remedial operations are necessary. Visual observations, the extents of the release and the cleanup of OHM from pavement have resulted in an achievement of background levels. A description of the response actions conducted at Site can be found in the following sections of this RAO Statement.

This RAO Statement was submitted within 120 days of the date of release and based upon the information presented above, the submission of the RAO fee is waived, per the NOR.





NOTES:

The affected area was estimated to be 0.91miles in length by 6 inches wide. The release was limited to only the traveled way of the Global vehicle and no migration of fuel to thestorm sewer system or other utilities was observed.

2.0 WORK PERFORMED AND FINDINGS

This portion of the RAO Statement provides the work performed since the original release on November 24, 2009, the findings and a schedule for any remaining tasks.

2.1 Status of Response Actions

Response actions consisting of containment of the leaking engine component and recovery of free product were conducted immediately following the release. This section of the report describes additional response actions conducted at the site. A detailed description of the actions performed to date is as follows:

Initial Response – Immediately after the release occurred, Global initiated response actions using the on-board spill kit on the leaking vehicle. Within two hours of the original release, the Town of Stoughton DPW mobilized and applied a layer of sand to the pavement to mitigate the impact of the spill. Photographic documentation of the response actions conducted at the site has been included in Appendix B.

Site Restoration – Following the mitigation of the release with sand to adsorb the fuel, Colantuoni Brothers used a street sweeper to collect the product from the asphalt roadway. The diesel fuel contaminated sand was placed into two 55 gallon barrels and taken off site prior to disposal.

Disposal of Remediation Waste – Tetra Tech EC arranged disposal of the diesel fuel contaminated soil at General Chemical Corporation of Framingham MA for recycling on December 11, 2009. Absorbent pads used during the initial response activities by Global were bulked with other oily waste for disposal.

Sampling – The observed spill was confined to a paved surface and did not reach soil, surface water or groundwater. After visual observations of the site during remedial efforts and upon completion Global attained applicable cleanup levels without the need of laboratory data. Photographic data of the spill clean up can be found in Appendix B.

2.2 Details of and/or Plan for management of Remediation Waste, Remediation Water and/or Remediation Monitoring

As described above, all remaining remediation waste was removed from the site between November 13 and December 11, 2009. Copies of the disposal documentation and Bill of Ladings for the contaminated soil have been included in Appendix C. No remediation monitoring is proposed for the Site. A summary of the waste removal is tabulated below. Final disposal documentation from General Chemical Corporation is included in Appendix D.

Remediation Waste Summary

Remediation Waste Stream	Date of Removal	Quantity	Units	Disposal Facility
Fuel-soaked Sand	12/11/2009	2	55-Gallon Drums	General Chemical Corp. 138 Leland Street Framingham, MA

3.0 FINDINGS AND CONCLUSIONS

3.1 Risk Characterization

Non applicable under 310 CMR 40.0901(3).

3.2 Presumptive Certainty

All activities were conducted in accordance with industry standards and generally accepted principles, as they apply to environmental assessment and remediation. Diesel fuel was removed from the ground surface using absorbent sand. No further evidence of free product was observed at the Site after this was accomplished. No groundwater, soil or surface water was impacted at any time during the response activities.

3.3 Need for Activity and Use Limitation

The Site meets the requirements for a Class A-1 RAO in which OHM was released onto a paved surface and has been cleaned to background levels under 310 CMR 40.0901(3) and no need for further activity is necessary.

3.4 Feasibility of Reducing Contaminant Levels to Background

This evaluation concluded that the Disposal Site has achieved background levels in the pavement in which the spill occurred.

3.5 LSP Opinion

This RAO has been prepared in accordance with 310 CMR 40.0973(7) and the LSP of Record has determined that a condition of No Significant Risk exists at this site. This determination is based upon the elimination of the source, photographic documentation and a visual observation of the site following the response.

The seal and signature of Larry Kahrs, LSP-of-Record, can be found on the BWSC-104 Form that accompanies this RAO statement.

3.6 Public Notification Activities

Notification letters were provided to the Town of Stoughton Selectmen’s Office in accordance with 310 CMR 40.1403(3)(f). Copies of these notification letters have been included in Appendix D.

RE:STOUGHTON - BWSC
Release Tracking Number: **4-22289**
Canton Street - Stoughton Center
NOTICE OF RESPONSIBILITY

URGENT LEGAL MATTER: PROMPT ACTION NECESSARY

Dear Mr. Tim Burbank:

On November 13, 2009 at 3:24 pm the Department of Environmental Protection ("MassDEP") received oral notification of a release and/or threat of release of oil and/or hazardous material at the above referenced property which requires one or more response actions. An unknown quantity of diesel fuel likely greater than 10 gallons was released along approximately a one mile stretch of Canton Street due to a mechanical failure within the engine compartment of a Global Remediation Services, Inc. vehicle. Stoughton Department of Public Works responded to the release and applied sand to the roadway mitigate the release.

The Massachusetts Oil and Hazardous Material Release Prevention and Response Act, M.G.L. c.21E, and the Massachusetts Contingency Plan (the "MCP"), 310 CMR 40.0000, require the performance of response actions to prevent harm to health, safety, public welfare and the environment which may result from this release and/or threat of release and govern the conduct of such actions. The purpose of this notice is to inform you of your legal responsibilities under State law for assessing and/or remediating the release at this property. For purposes of this Notice of Responsibility, the terms and phrases used herein shall have the meaning ascribed to such terms and phrases by the MCP unless the context clearly indicates otherwise.

MassDEP has reason to believe that the release and/or threat of release which has been reported is or may be a disposal site as defined by the M.C.P. MassDEP also has reason to believe that you (as used in this letter, "you" refers to Global Remediation Services, Inc.) are a Potentially Responsible Party (a "PRP") with liability under M.G.L. c.21E §5, for response action costs. This liability is "strict", meaning that it is not based on fault, but solely on your status as owner, operator, generator, transporter, disposer or other person specified in M.G.L. c.21E §5. This liability is also "joint and several", meaning that you may be liable for all response action costs incurred at a disposal site regardless of the existence of any other liable parties.

MassDEP encourages parties with liabilities under M.G.L. c.21E to take prompt and appropriate actions in response to releases and threats of release of oil and/or hazardous materials. By taking prompt action, you may significantly lower your assessment and cleanup costs and/or avoid liability for costs incurred by MassDEP in taking such actions. You may also avoid the imposition of, the amount of or reduce certain permit and/or annual compliance assurance fees payable under 310 CMR 4.00. Please refer to M.G.L. c.21E for a complete description of potential liability. For your convenience, a summary of liability under M.G.L. c.21E is attached to this notice.

You should be aware that you may have claims against third parties for damages, including claims for contribution or reimbursement for the costs of cleanup. Such claims do not exist indefinitely but are governed by laws which establish the time allowed for bringing litigation. MassDEP encourages you to take any action necessary to protect any such claims you may have against third parties.

At the time of oral notification to MassDEP, the following response actions were approved as an Immediate Response Action (IRA):

- Continued assessment.
- Deployment of absorbent/containment materials.
- All Remediation Waste must be properly stored/handled and disposed of within 120 days from the date of generation per 310 CMR 40.0030.

ACTIONS REQUIRED

Additional submittals are necessary with regard to this notification including, but not limited to, the filing of a written IRA Plan, IRA Completion Statement and/or a Response Action Outcome (RAO) statement. **The MCP requires that a fee of $1,200 be submitted to MassDEP when an RAO statement is filed greater than 120 days from the date of initial notification.** Specific approval is required from MassDEP for the implementation of all Immediate Response Actions (IRAs) pursuant to 310 CMR 40.0420. Release Abatement Measures may not be conducted until a RAM Plan is submitted pursuant to 310 CMR 40.0443. Assessment activities, the construction of a fence and/or the posting of signs are actions that are exempt from this approval requirement.

In addition to oral notification, 310 CMR 40.0333 requires that a completed Release Notification Form (BWSC-103, attached) be submitted to MassDEP within sixty (60) calendar days of **November 13, 2009**.

You must employ or engage a Licensed Site Professional (LSP) to manage, supervise or actually perform the necessary response actions at this site. You may obtain a list of the names and addresses of these licensed professionals from the Board of Registration of Hazardous Waste Site Cleanup Professionals by calling (617) 556-1091 or visiting http://www.state.ma.us/lsp. MassDEP has Mr. Larry Kahrs of Foster Wheeler Environmental as the LSP of record for this release.

Unless otherwise provided by MassDEP, potentially responsible parties ("PRP's") have one year from the initial date of notification to MassDEP of a release or threat of a release, pursuant to 310 CMR 40.0300, or from the date MassDEP issues a Notice of Responsibility, whichever occurs earlier, to file with MassDEP one of the following submittals: (1) a completed Tier Classification Submittal; (2) an RAO Statement or, if applicable, (3) a Downgradient Property Status. The deadline for either of the first two

submittals for this disposal site is **November 13, 2010**. If required by the MCP, a completed Tier I Permit Application must also accompany a Tier Classification Submittal.

This site shall not be deemed to have had all the necessary and required response actions taken unless and until all substantial hazards presented by the release and/or threat of release have been eliminated and a level of No Significant Risk exists or has been achieved in compliance with M.G.L. c.21E and the MCP.

If you have any questions relative to this Notice, please contact Jaime Goncalves at the letterhead address or at (508) 946-2773. All future communications regarding this release must reference the following Release Tracking Number: **4-22289**.

Sincerely,

Daniel Crafton, Acting Chief
Emergency Response / Release

BUILDING AND ZONING DEPARTMENT

TOWN OFFICES: Ten Pearl St./Stoughton, MA. 02072

October 30, 1979

Mr. Eugene O'Neil
P.O. Box 27
Babson Park, MA 02157

RE: 25 BROCK STREET

Dear Mr. O'Neil:

On October 26, 1979 Lieut. Anthony Novello, Stoughton Fire Department, accompanied me on an inspection of the buildings on your property at the above referenced address.

The wooden structure occupied by "Rick's Kitchens" has the following items which must be corrected:

1. The stairs are structurally unsafe.

2. The venting of the oil burner is not a proper, safe installation.

3. All the windows in the unoccupied portion are broken and open and should be boarded up.

The brick building has several windows on the ground level which should be boarded up.

Your prompt attention to this matter is appreciated.

Very sincerely yours,

Charles J. Urciuoli

CHARLES J. URCIUOLI
Building and Zoning Official

TOWN OF
STOUGHTON
COMMONWEALTH OF
MASSACHUSETTS

TOWN OFFICES: Ten Pearl St./Stoughton, MA. 02072
30 Freeman Street

Date October 26, 1979

Name Mr. Eugene J. O'Neil, Jr.

52 Clarke Rd.

Needham, Mass. 02192

Re: Inspection of property
25 Brock Street,
Stoughton, Mass. 02072

As a result of an inspection recently of the premises, structure, open land area or vehicle owned, occupied or otherwise under your control, the following recommendations. are submitted and shall serve as a notice of violation of fire laws. These recommendations are made in the interest of fire prevention and to correct conditions that are or may become dangerous as a fire hazard or are in violation of law.

You are hereby notified to remedy said violations name below within 14 days, above date.

Such further action will be taken as the law requires, for failure to comply with the above requirements with the stipulated time.
(Reference: General Laws of Commonwealth of Massachusetts, Chapter 148, Section 30; and the Stoughton Fire Code Article #1)

1. Front building with open windows on street level.

2. Rear building with tenant Rick"s Kitchen.
Oil Burner and Oil Storage in Violation of Cmr 4.00 and Fire Prevention Regulation #3. Including improper chimney.

3. Same building should be boarded up and secured to prevent unauthorized entry.

4. Sprinkler System shut off. Chapter 148 Section 27A in Violation.

We have therefore requesting the Building Inspector take such immediate steps as may be necessary to eliminate this hazardous building or building be well secured and maintain. Since we last talked about the above matter we found no improvement of same.

Your cooperation in this matter will be greatly appreciated and make further action unnecessary.

Very sincerely yours,

Lt. Anthony T. Novello, Inspector
Fire Prevention Bureau.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OF DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT.** Purchaser accepts this Report AS IS. Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

South Coast Rail Project
Stoughton Station, Stoughton, Massachusetts
Site Photos Taken on April 26, 2012
by Vanasse Hangen Brustlin, Inc.

Photo #1: View of 48 Wyman Street property, taken facing north.

Photo #2: View of 48 Wyman Street property, taken facing southwest.

Photo #3: Parcel at 48 Wyman shown to the left, taken facing southeast.

Photo #4: View of parking area at 2 Canton Street property, taken facing northwest.

South Coast Rail Project
Stoughton Station, Stoughton, Massachusetts
Site Photos Taken on April 26, 2012
by Vanasse Hangen Brustlin, Inc.

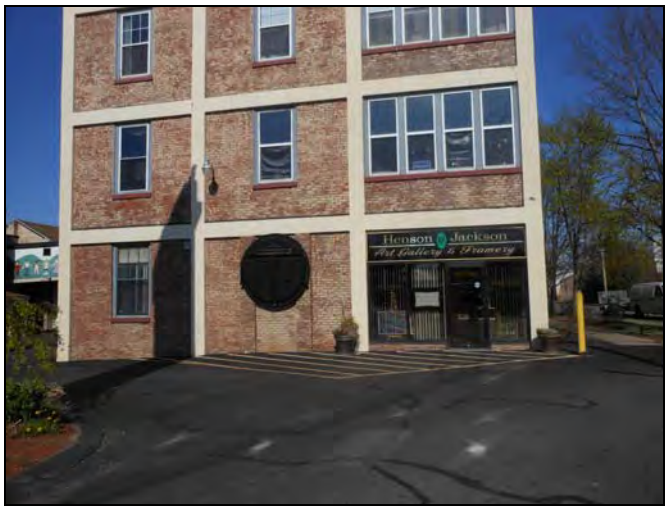

Photo #5: Trackside Plaza located at 2 Canton Street property, taken facing northwest.

Photo #6: A portion of the building at 2 Canton Street, showing an old boiler, taken facing northwest.

Photo #7: The rear of 2 Canton Street, taken facing south.

Photo #8: View of the 2 Canton Street property from Summer Street, taken facing north.

South Coast Rail Project
Stoughton Station, Stoughton, Massachusetts
Site Photos Taken on April 26, 2012
by Vanasse Hangen Brustlin, Inc.

Photo #9: View of the vacant parcel located at Morton Street (Parcel 054-407).

Photo #10: View of Murphy Coal Company parcel, including fuel oil ASTs, located off Morton Square (parcel 054-406), taken facing south.

Photo #11: View of Murphy Coal Company parcel (off Morton Square), taken facing west.

Photo #12: View of ASTs located at Parcel 054-406, taken facing west.

South Coast Rail Project
Stoughton Station, Stoughton, Massachusetts
Site Photos Taken on April 26, 2012
by Vanasse Hangen Brustlin, Inc.

Photo #13: View of 25 Brock Street property from Brock Street showing abutting railroad tracks.

Photo #14: View of 25 Brock Street property from Brock Street.

Photo #15: View of 25 Brock Street property from Brock Street showing additional buildings.

Photo #16: View of storage tanks at Alpha Chemical Company, which abuts the Site to the north and west, taken facing east.

Appendix 4.14-A

Detailed Bridge and Culvert Inventory

Identification	Figure #	Structure Description	Area Setting: (Ur)ban, (S)uburban, (Un)developed; (C)ommercial, (I)ndustrial or (I)institutional, (O)pen space, (R)esidential (East/West)	ANRAD Wetland Description (East/West) (ND= no ANRAD description, X= no wetland)	Function	CAPS Landscape (see Appendix 4-2)	Connectivity Value (Wildlife Habitat, Fishery)	T&E Species	Environmental Recommendations/Notes
Stoughton Line									
Bridge over Forge Pond [Pequit Brook]	Fig. 4.14-11a	18' long stone arch bridge (historic)	SR/SC	Open water with a bordering forested wetland associated with Forge Pond/Open Water with a bordering forested wetland associated with Forge Pond	Pond connector.	Freshwater wetland and aquatic (at bridge site only)	DFW & DMF fishery; no wildlife habitat	No	Historic nature of bridge precludes meeting Stream Crossing standards.
Bridge over Mill Brook [Beaver Meadow Brook]	Fig. 4.14-11a	12' long stone arch bridge	UrR/UrR	Forested wetland system associated with Beaver Meadow Brook/ Red Maple wetland with scrub shrub components associated with Beaver Meadow Brook pond system	Perennial stream conveyance.	None	No fishery; no wildlife habitat	No	Meet Stream Crossing standards.
CV-ST 2.47	Fig.4.14-11a	NA	UrR/SO	X/Intermittent stream channel	Upland drainage.	None	No fishery; no wildlife habitat	No	Replace in kind.
CV-ST 3.40	Fig. 4.14-11a	NA	SCI/SO	X/Intermittent stream channel	Upland drainage.	None	No fishery; no wildlife habitat	No	Replace in kind.
CV-ST 4.47	Fig. 4.14-11b	2.5'x2.5' stone box culvert, 55' long	SCI/SO	Forested wetland associated with perennial stream/ Perennial stream originating from unnamed pond east of Rt. 138 and flowing into Woods Pond	Perennial stream conveyance.	None	No fishery; no wildlife habitat	No	Hydraulic analysis. If providing hydrologic control do not alter hydrology; if not providing hydrologic control replace to meet Stream Crossing standards
CV-ST 4.94	Fig. 4.14-11b	2'x2' stone box culvert, 40' long	SC/SR	Intermittent stream channel connected to ST3 (100 series)/ Intermittent stream channel associated with a pond and its emergent wetland system	Intermittent stream conveyance.	None	No fishery; no wildlife habitat	No	Replace in kind.
CV-ST 5.04	Fig. 4.14-11b	12" VCP culvert, 15' long	SCI/SR	X/Isolated depression with standing water and minimal emergent wetland vegetation	Upland drainage.	None	No fishery; no wildlife habitat	No	Replace in kind.
CV-ST 5.26	Fig. 4.14-11b	3'x3' stone box culvert, 30' long	SCI/SR	Intermittent stream channel/ Intermittent stream channel connected to ST4A (100 series)	Intermittent stream conveyance.	None	No fishery; no wildlife habitat	No	Replace in kind.
CV-ST 5.76	Fig. 4.14-11b	4'x5' stone box culvert, 50' long	SC/SO	X/Large forested wetland with an intermittent stream channel	Upland drainage.	None	No fishery; no wildlife habitat	No	Replace in kind.
CV-ST 5.82	Fig. 4.14-11b	3'x4' stone box culvert, unknown length	SC/SO	Intermittent stream channel connected to ST7/ Large forested wetland with an intermittent stream channel	Wetland equalizer.	None	No fishery; no wildlife habitat	No	Replace in kind.

Identification	Figure #	Structure Description	Area Setting: (Ur)ban, (S)uburban, (Un)developed; (C)ommercial, (I)ndustrial or (I)institutional, (O)pen space, (R)esidential (East/West)	ANRAD Wetland Description (East/West) (ND= no ANRAD description, X= no wetland)	Function	CAPS Landscape (see Appendix 4-2)	Connectivity Value (Wildlife Habitat, Fishery)	T&E Species	Environmental Recommendations/Notes
CV-ST 5.94	Fig. 4.14-11b	2'x2' stone box culvert, 55' long	SO/SO	Large open marsh associated with Whitman Brook/ Associated with Whitman Brook	Upland drainage.	None	No fishery; wildlife habitat at Stoughton Memorial Conservation Land	No	Replace in kind
CV-ST 6.17	Fig. 4.14-11b	2'x2' stone box culvert, 50' long	UnO/UnO	Forested wetland associated with intermittent stream/ Forested wetland along intermittent stream connected to ST10 (100 series)	Wetland equalizer.	Freshwater wetland and aquatic adjacent west	No fishery; no wildlife habitat	No	Replace in kind.
CV-ST 6.45	Fig. 4.14-11b	2'x2.5' stone box culvert, 75' long	UnO/S-UnO	ND/Intermittent stream	Intermittent stream conveyance.	Freshwater wetland and aquatic adjacent east	No fishery; wildlife habitat at Stoughton Memorial Conservation Land northwest.	No	Meet Stream Crossing Standards.
CV-ST 6.69	Fig. 4.14-11b	3'x3' stone box culvert, 70' long	UnO/UnO	Large forested wetland associated with an intermittent stream (BF 98-101) and Whitman Brook (200 and 300 series)/ Forested wetland with shrub-scrub components	Wetland equalizer.	Freshwater wetland and aquatic adjacent west	No fishery; wildlife habitat in Whitman Brook wetland system	No	Meet Stream Crossing Standards.
Bridge over Cowessett Brook [Whitman Brook]	Fig. 4.14-11b	20' long deck stringer bridge	UnO/UnO	Large forested wetland associated with an intermittent stream (BF 98-101) and Whitman Brook (200 and 300 series)/ Forested wetland with shrub-scrub components	Perennial stream conveyance.	Freshwater wetland and aquatic	DFW & DMF fishery; wildlife habitat in Whitman Brook wetland system	No	Meet Stream Crossing Standards.
CV-ST 6.83	Fig. 4.14-11b	3.5'x5' stone box culvert, 30' long	UnO/UnO	Shrub-scrub wetland associated with intermittent stream to Whitman Brook/ Intermittent stream connected to EA5.3; separated from EA6 [to north] by unpaved walkway	Intermittent stream conveyance.	Freshwater wetland and aquatic	No fishery; wildlife habitat in Whitman Brook wetland system	No	Meet Stream Crossing Standards.
CV-ST 7.06	Fig. 4.14-11b	2.5'x2.5' stone box culvert, 40' long	UnO/UnO	Forested wetland associated with intermittent stream channel, connected to EA7/ Red Maple swamp connected to a larger wetland outside limit of delineation	Intermittent stream conveyance.	None	No fishery; wildlife habitat in wetland system	No	Meet Stream Crossing Standards.
CV-ST 7.21	Fig. 4.14-11b	2.5'x4' stone box culvert, 50' long	UnO/UnO	Intermittent stream channel connected to EA8 and EA10/ Red Maple swamp connected to EA9 under ROW by an intermittent channel	Intermittent stream conveyance.	None	No fishery; wildlife habitat in wetland system	No	Meet Stream Crossing Standards.

Identification	Figure #	Structure Description	Area Setting: (Ur)ban, (S)uburban, (Un)developed; (C)ommercial, (I)ndustrial or (I)institutional, (O)pen space, (R)esidential (East/West)	ANRAD Wetland Description (East/West) (ND= no ANRAD description, X= no wetland)	Function	CAPS Landscape (see Appendix 4-2)	Connectivity Value (Wildlife Habitat, Fishery)	T&E Species	Environmental Recommendations/Notes
CV-ST 7.23	Fig. 4.14-11b	2'x3' stone box culvert, 55' long	UnO/UnO	Intermittent stream channel connected to EA8 and EA10/ Scrub-shrub wetland connected to EA9	Intermittent stream conveyance.	None	No fishery; wildlife habitat in wetland system	No	Meet Stream Crossing Standards.
CV-ST 7.42	Fig. 4.14-11b	4'x6' stone box culvert, 40' long	SR/SR	Intermittent stream/ Intermittent stream	Intermittent stream conveyance.	None	No fishery; wildlife habitat in wetland system	No	Replace in kind.
Bridge over Small Creek [Quesett Brook]	Fig. 4.14-11b	15' long deck stringer bridge	UrR/UrC	Detention basin/ Large forested wetland associated with an intermittent stream.	Perennial stream conveyance.	None	DFW & DMF fishery; no wildlife habitat	No	Meet Stream Crossing Standards.
CV-ST 8.76	Fig. 4.14-11b	2'x1' stone box culvert, unknown length	UnO/S-UnO	Large depression connected to EA16 under ROW/X	Wetland equalizer.	None	No fishery; no wildlife habitat	No	Hydraulic analysis. If providing hydrologic control do not alter hydrology; if not providing hydrologic control replace to meet Stream Crossing standards
CV-ST 9.22	Fig. 4.14-11c	5'x6' stone box culvert, unknown length	UnO/S-UnO	NA	Open upland passage.	None	No fishery; no wildlife habitat	No	Replace in kind.
CV-ST 9.35	Fig. 4.14-11c	4'x4' stone box culvert, 50' long	UnO/UnO	Forested wetland connected to EA22 under ROW/ Certified Vernal Pool	Wetland equalizer.	None	No fishery; wildlife habitat in wetland system	No	Meet Stream Crossing Standards
CV-ST 9.65	Fig. 4.14-11c	3'x3' stone box culvert, 50' long	UnO/UnO	Red Maple swamp connected to EA24 under ROW/ Forested wetland includes a Certified Vernal Pool	Intermittent stream conveyance.	None	No fishery; wildlife habitat in wetland system	No	Meet Stream Crossing Standards.
CV-ST 9.83	Fig. 4.14-11c	3'x3.5' stone box culvert, unknown length	UnO/UnR	Connected to EA26 under ROW/ ND	Wetland equalizer.	None	No fishery; wildlife habitat in wetland system	No	Replace in kind.
No #	Fig. 4.14-11c	1.2'x2' stone box culvert, unknown length	UnO/UnI	ND/X	Upland drainge.	None	No fishery; no wildlife habitat	No	Replace in kind.
CV-ST 10.05	Fig. 4.14-11c	2'x2' stone box culvert, 40' long	UnO/UnR	Certified Vernal Pool/ Certified Vernal Pool	Wetland equalizer.	None	No fishery; wildlife habitat	Yes	Meet Stream Crossing Standards.
CV-ST 10.41	Fig. 4.14-11c	18" CIP culvert, 40' long	UnO/UnR	X/X	Upland drainage.	None	No fishery; no wildlife habitat	Yes	Replace in kind.
CV-ST 10.90	Fig. 4.14-11c	12" CMP culvert, 50' long	UnR/UnR	Forested wetland associated with Black Brook wetland system/ Part of the Black Brook wetland system	Wetland equalizer.	None	No fishery; wildlife habitat in wetland system	Yes	Meet Stream Crossing Standards.
CV-ST 10.95	Fig. 4.14-11c	4'x6' stone box culvert, 40' long	UnO/UnR	Black Brook and its associated wetland system [Crossing 1]	Perennial stream conveyance.	None	DMF fishery; wildlife habitat	Yes	Meet Stream Crossing Standards.

Identification	Figure #	Structure Description	Area Setting: (Ur)ban, (S)uburban, (Un)developed; (C)ommercial, (I)ndustrial or (I)institutional, (O)pen space, (R)esidential (East/West)	ANRAD Wetland Description (East/West) (ND= no ANRAD description, X= no wetland)	Function	CAPS Landscape (see Appendix 4-2)	Connectivity Value (Wildlife Habitat, Fishery)	T&E Species	Environmental Recommendations/Notes
CV-ST 11.11	Fig. 4.14-11c	18" CIP culvert, 30' long	UnO/UnR	Black Brook and its associated wetland system [Crossing 1]	Wetland equalizer.	None	No fishery; wildlife habitat in wetland system	Yes	Meet Stream Crossing Standards.
Bridge over Black Brook	Fig. 4.14-11c	12" CIP culvert, 30' long (washed out)	UnO/UnR	Black Brook and its associated wetland system [Crossing 2]	Perennial stream conveyance.	Freshwater wetland and aquatic adjacent west	DMF fishery; wildlife habitat	Yes	Meet Stream Crossing Standards.
CV-ST 11.23	Fig. 4.14-11c	18" CIP culvert, unknown length	UnO/UnO	Hockomock Swamp/ Hockomock Swamp	Upland drainage.	None	No fishery; wildlife habitat in upland	Yes	Replace in kind.
CV-ST 11.33	Fig. 4.14-11c	18" CIP culvert, 40' long	UnO/UnO	Hockomock Swamp/ Hockomock Swamp	Upland drainage.	None	No fishery; wildlife habitat in upland	Yes	Replace in kind.
CV-ST 11.34	Fig. 4.14-11c	18" CIP culvert, 40' long	UnO/UnO	Hockomock Swamp/ Hockomock Swamp	Upland drainage.	None	No fishery; wildlife habitat in upland	Yes	Replace in kind.
CV-ST 11.44	Fig. 4.14-11c	18" DIP/CIP culvert, 30' long	UnO/UnO	Scrub-shrub wetland/ Intermittent stream connected to EA86.	Wetland equalizer.	None	No fishery; wildlife habitat in wetland system	Yes	Replace in kind.
CV-ST 11.59	Fig. 4.14-11c	3'x3' stone box culvert, 50' long	UnO/UnO	Forested wetland connected to EA82 under ROW/ Bordering an intermittent stream	Wetland equalizer.	Freshwater wetland and aquatic	No fishery; wildlife habitat in wetland system	Yes	Meet Stream Crossing Standards.
CV-ST 11.61	Fig. 4.14-11c	36" CMP culvert, 50' long	UnO/UnO	Forested wetland connected to EA82 under ROW/ Bordering an intermittent stream	Wetland equalizer.	None	No fishery; wildlife habitat in wetland system	Yes	Meet Stream Crossing Standards.
CV-ST 11.65	Fig. 4.14-11c	2'x2' stone box/ 12" CMP culvert, 40' long	UnO/UnO	Forested wetland connected to EA82 under ROW/ Bordering an intermittent stream	Wetland equalizer.	None	No fishery; wildlife habitat in wetland system	Yes	Meet Stream Crossing Standards.
CV-ST 11.91	Fig. 4.14-11c	8'x6' stone/rail box culvert, 25' long	UnI/UnO	Certified Vernal Pool connected to EA78 under ROW/ Certified Vernal Pool	Intermittent stream conveyance.	None	No fishery; wildlife habitat in wetland system	Yes	Meet Stream Crossing Standards.
No #	Fig. 4.14-11c	18" PVC culvert, unknown length	UnO/UnO	ND/X	Upland drainage.	None	No fishery; no wildlife habitat	No	Could be eliminated.
CV-ST 12.09	Fig. 4.14-11c	6'x6' stone/rail box culvert, unknown length	UnO/UnO	Intermittent stream connected to EA67 under ROW/ Certified Vernal Pool	Wetland equalizer.	Freshwater wetland and aquatic	No fishery; wildlife habitat in wetland system	Yes	Daylight culvert under new trestle

Introduction

CAPS (the Conservation Assessment and Prioritization System) was used to assess several alternative routes of the proposed South Coast Rail system in southeastern Massachusetts. A CAPS analysis was conducted for each of the proposed routes (Attleboro, Stoughton, and Stoughton-Whittenton) and compared to a base scenario representing current conditions. Versions of the Stoughton and Stoughton-Whittenton route were analyzed with and without a trestle through Hockomock Swamp. The CAPS landcover grid was modified to include proposed rail lines, and CAPS was run to estimate the Index of Ecological Integrity (IEI) for each route scenario. The difference between the IEI for each route scenario and the base IEI values provided an estimate of the loss in ecological integrity for that route. These differences are expressed graphically and in terms of IEI units. A sensitivity analysis was run to assess the effect of uncertainty in parameters.

Overview of CAPS

The Conservation Assessment and Prioritization System (CAPS) is an ecosystem-based (coarse-filter) approach for assessing the ecological integrity of lands and waters. We define *ecological integrity* as the ability of an area to support biodiversity and the ecosystem processes necessary to sustain biodiversity, over the long term. CAPS is a computer software program and an approach to prioritizing land for conservation based on the assessment of various ecological communities (e.g. forest, shrub swamp,

headwater stream) within an area. This approach combines principles of landscape ecology and conservation biology with the capacity of modern computers to compile spatial data and characterize landscape patterns.

The CAPS approach begins with the characterization of both the developed and undeveloped elements of the landscape (Appendix A). With a computer base map depicting various classes of developed and undeveloped land, we then evaluate a variety of landscape-based variables ("metrics"; Appendix C). A metric may, for example, take into account how well a point in the landscape is connected to similar points, the intensity traffic on nearby roads, or the expected vulnerability to invasions by exotic plants. The results of each metric are rescaled by percentiles for each community so that, for instance, the best 10% of marshes have values ≥ 0.90, and the best 25% have values ≥ 0.75. This is done to adjust for differences in units of measurement among metrics and to account for differences in the range of metric values for each community. The rescaling by community is done to facilitate identifying the "best" of each community, as opposed to the best overall – which is strongly biased towards the dominant, matrix-forming communities.

Various metrics are applied to the landscape and then integrated in weighted linear combinations as models for predicting ecological integrity. The rescaled values are weighted using weights determined by expert teams, to reflect the relative importance of each metric for each community (Appendix D), and then added together to compute an overall IEI. Thus, the final index of ecological integrity for each cell is a weighted combination of the metric outputs for that cell, based on the community the cell falls in. This process results in a final Index of Ecological Integrity (IEI) for each point in the landscape based on models constructed separately for each ecological community.

Because CAPS provides a quantitative assessment of ecological integrity it can be used for comparing various scenarios. In essence, scenario analysis involves running CAPS separately for each scenario, and comparing results to determine the loss (or gain) in IEI units. This scenario testing capability can be used to evaluate and compare the impacts of development projects on habitat conditions as well as the potential benefits of habitat management or environmental restoration. CAPS is an objective and flexible approach for assessing ecological integrity and supporting decision-making for land protection, habitat management, ecological restoration, project review and permitting to protect habitat and biodiversity.

Methods

This analysis was based on the most recent CAPS statewide run (CAPSma 2009; Conservation Assessment and Prioritization System (CAPS) Preliminary Statewide Massachusetts Assessment, June 2, 2009), with modifications as necessary to more fully represent the effects of railroads.

Study area – The study area consisted of the entire Taunton watershed, plus a 5 km buffer around the Northeast Main Line, the New Bedford Corridor, and all rail lines included in various scenarios (Fig. 1). This buffer allows CAPS to capture all changes in

IEI among scenarios. Using the entire Taunton watershed gives CAPS a large enough context to reasonably scale IEI.

Scenarios – Six scenarios were represented in the analysis (scenario abbreviations, used in grid names, are supplied in brackets):

1. [X] Current (base) scenario
2. [A] Attleboro
3. [S] Stoughton at grade
4. [ST] Stoughton with trestle
5. [W] Stoughton-Whittenton at grade
6. [WT] Stoughton-Whittenton with trestle

The base scenario represents the current conditions. It was determined that the Rapid Bus alternative would essentially be the same as the base scenario because this alternative would at most differ in CAPS only in a very slight increase in traffic rate (on the order of 0.01%). In fact one could argue that the bus scenario would actually result in a decrease in traffic.

Fig. 1. Study area for South Coast Rail analysis.

Representing rail lines – We added several new cover types to CAPS to adequately represent rail lines. We split the abandoned rail class into "abandoned rail with tracks" and "abandoned rail without tracks." New classes were added for freight, passenger, and commuter rail lines, as well as "commuter rail line with a trestle" and "commuter rail

line with a retaining wall." Abandoned rail lines represented in CAPS (from MassGIS trains layer) were considered to have no tracks. Existing abandoned rails were replaced where they were more accurately represented in SCR data. The classes of trains (freight, passenger, commuter, and combinations of these) were derived from MassGIS data and SCR data. The number of tracks on each line were estimated based on supplied track numbers in MassGIS data. In general, lines from SCR scenarios were represented as having two sets of tracks, with the exception of the Northeast Corridor from Readville to the Attleboro bypass, which has three sets.

The frequency of trains was estimated as 2 trains/day for freight, as 33 trains/day for commuter (based on a survey of MBTA schedules), and passenger lines were assigned a number of trains/day by line from Amtrack schedules, varying from 2 to 20 trains/day. The number of cars per train were estimated at 25 for freight, 8 for passenger, and 6 for commuter rail.

Abandoned rail beds without tracks were assumed to have lost their ballast due to erosion over time; abandoned rails with tracks were assumed to have retained ballast. All rails were assumed to be unfenced; although commuter rails are generally fenced in populated areas, these areas generally have little value in CAPS anyway.

Parameters for rail lines – New cover types were parameterized by an expert team consisting of Mark Anderson, Andy Finton, and Jessica Dyson, from The Nature Conservancy, James deNormandie from MassAudubon and MassWildlife, and Brad Compton and Scott Jackson from UMass Amherst. The group met on July 16 and came up with a scheme for parameterizing a new variable, terrestrial barriers (Table 1; including barriers on highways and other anthropogenic barriers to movement). This expert team also decided to represent traffic rates for rails based on a multiple of the estimated number of train cars per day. We discounted the traffic rate for trains running over a trestle because collision mortality would be essentially eliminated, although avoidance because of noise would remain essentially unchanged. Parameters used for trains are shown in Table 2. Rail stations were given the same values as the commercial and industrial land cover class.

Analysis – CAPS was run for each scenario. Watershed metrics, which are essentially unaffected by the various scenarios, were used directly from the 2009 statewide run. Direct loss (where rail lines or stations fell on undeveloped land) was calculated by the complete loss of IEI for affected cells. Indirect loss was calculated for each metric, and the integrity model was used to create an overall indirect loss grid for each scenario. Finally, direct and indirect losses were combined to give a delta grid for each scenario. A sensitivity analysis was conducted by varying the relative traffic rate for trains from 1 train car = 5 automobiles to 1 train car = 100 automobiles. The sensitivity analysis was run for the three metrics that are affected by traffic rate: connectedness, similarity, and traffic intensity. The sensitivity analysis gives a range of percent loss for each scenario, to help bracket our uncertainty.

Appendices – Land cover classes and codes are given in Appendix A. Input data sources are described in Appendix B. Appendix C describes the CAPS metrics, and

Appendix D gives the weights used for each metric and community or group of communities. Appendix E lists the GIS grids and coverages supplied with the results. Finally, Appendix F includes detailed images of the IEI change grids.

Table 1. Scheme for assigning values for terrestrial barriers. A feature with multiple values (e.g., double rail with ballast) is assigned the sum of the maximum value and one half of other values.

Value	Terrestrial Barriers
1	No barrier Abandoned rail without tracks Trestle (≥ 3 m high)
2	Single set of rails Ballast Trestle (<3 m high)
3	Standard fence* Double set of rails Abandoned rail with tracks Single rail + ballast
4	Double rail + ballast [Triple rail + ballast =4.5]
5	
6	
7	Jersey barrier
8	Enhanced fence†
9	
10	Noise barrier wall Retaining wall

* Standard fence = 4' chain link, poorly maintained
† Enhanced fence = 10' chain link, barbed ware on top, well-maintained

Table 2. Assignment of scores for terrestrial barriers and traffic rate for rail lines.

Rail type	Ballast?	Number of tracks	Fence?	Terrestrial barrier score	Trains/ day	Cars/train	Traffic rate
Rail trail	No	0	No	1	0	0	cars/day × 20*
Abandoned railbed no tracks	No	0	No	1	0	0	
Abandoned rail with tracks	Yes	1-3	No	single track: 3 double track: 4 triple track: 4.5	0	0	
Train (freight)	Yes	1-3	No		2	25	
Train (passenger)	Yes	1-3	No		*ntrains*	8	
Train (commuter)	Yes	1-3	No		33	6	
Train (freight + passenger)	Yes	1-3	No		Combined	Combined	
Train (freight + commuter)	Yes	1-3	No				
Train (passenger + commuter)	Yes	1-3	No				
Train (freight + passenger + commuter)	Yes	1-3	No				
Train (retaining wall)	No	1-3	Retaining wall: 10	10	33	6	
Train (trestle)†	No	0	No	2	33	6	As above / 3

* Varied for sensitivity analysis, range from 5-100.
† Assumed to be commuter rail.

Results

The results of the CAPS scenario analysis are shown graphically in Fig. 2, Appendix F, and summarized in Table 3. Overall the two routes through Hockomock Swamp showed the greatest estimated loss in ecological integrity, followed by the Attleboro route with considerably less influence (77-80% of the loss for the various Stoughton and Stoughton-Whittenton alternatives). The trestle alternatives through Hockomock Swamp reduced the modeled loss of ecological integrity somewhat, although many of the benefits of a trestle are likely to occur at a local scale below that of the CAPS analysis.

Differences among the various scenarios are obscured to some degree by large sections of the routes common to all the alternatives. To better highlight the differences among the scenarios we computed IEI loss for each scenario only for those sections that were not shared among all alternatives (Fig. 3, Table 3). Focusing only on those sections of the routes that differ among the alternatives serves to further differentiate the Attleboro route as the alternative with the least impact on IEI values.

Table 3. Assessment of South Coast Rail scenarios in terms of IEI units.

Scenario	Loss of IEI Units Full Extent	Loss of IEI Units Excluding Common Route Sections
Base	0.0	0.0
Attleboro	379.3	206.8
Stoughton with trestle	474.5	302.0
Stoughton-Whittenton with trestle	481.8	309.3
Stoughton at grade	484.6	312.1
Stoughton-Whittenton at grade	492.0	319.5

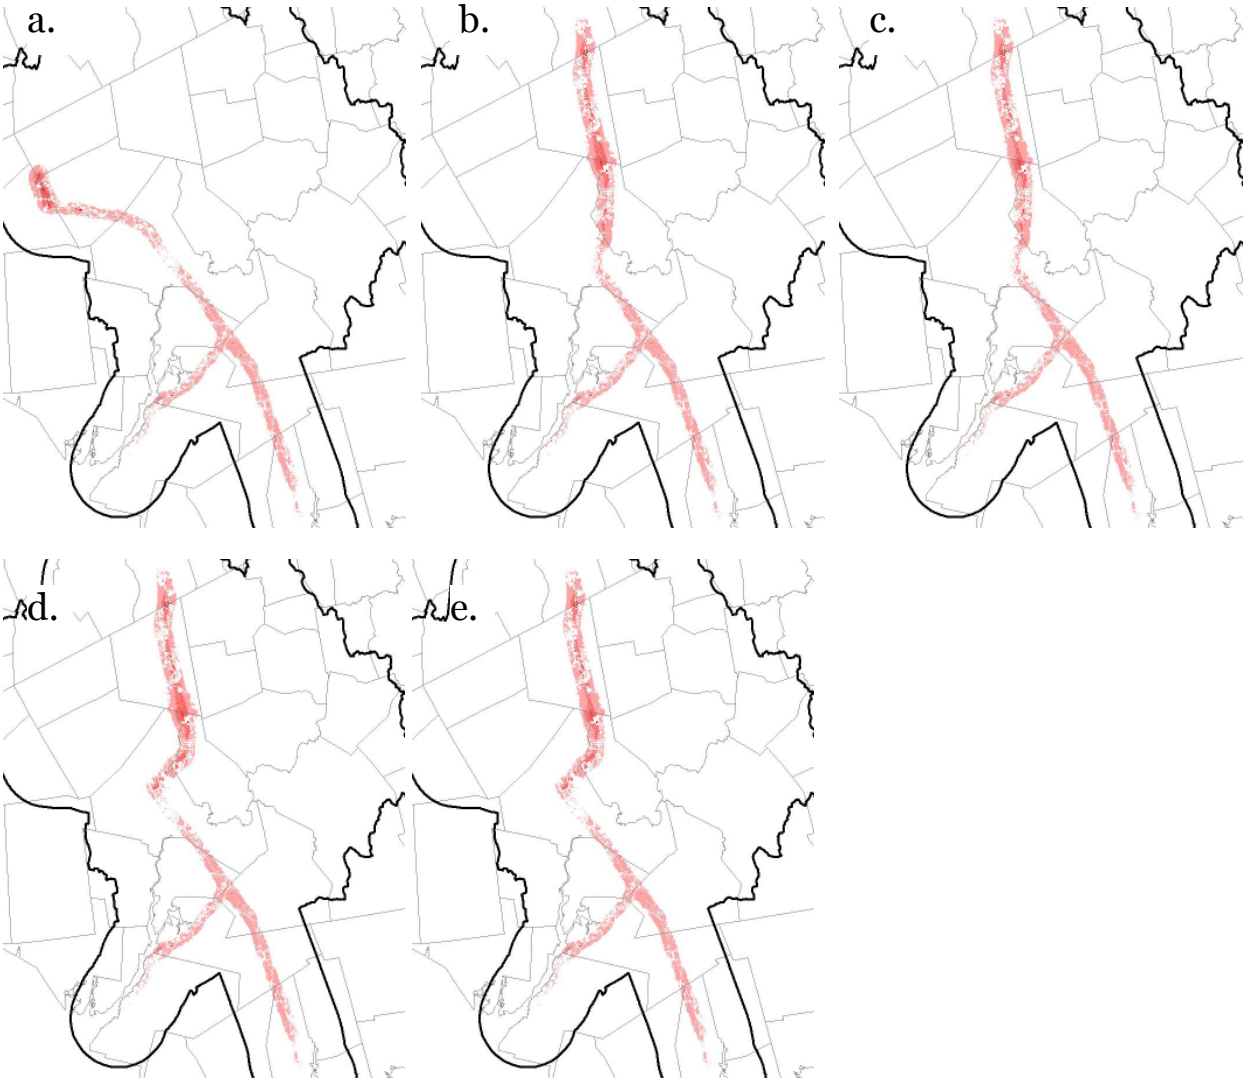

Fig. 2. Modeled loss in ecological integrity for (a) the Attleboro route, (b) the Stoughton route at grade, (c) the Stoughton route with the proposed trestle, (d) Stoughton-Whittenton route at grade, and (e) the Stoughton-Whittenton route with the proposed trestle. Darker areas represent greater loss. See Appendix F for more detailed versions of these images.

Table 4 shows loss split into direct loss (within the footprint of new development) and indirect loss. Not surprisingly, direct loss is a small proportion of the total IEI loss, mostly attributable to stations, because most of the rails would run on land already mapped as developed (such as abandoned rail beds).

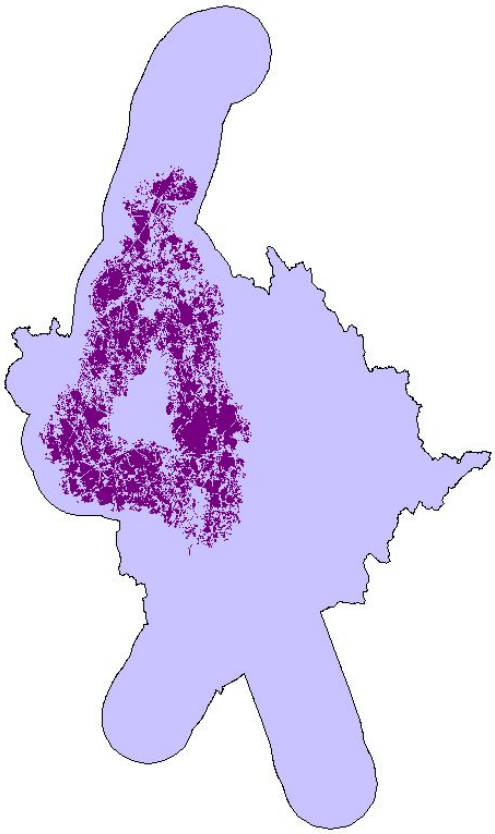

Fig. 3. Areas (denoted in purple) in which the IEI of two or more scenarios differ from each other. Areas that are not highlighted are either unaffected by any of the scenarios, or affected identically by all scenarios.

Table 4. Loss of IEI Units (from Table 3) split into direct and indirect loss.

Scenario	Direct loss (IEI units)	Indirect loss (IEI units)
Base	0.0	0.0
Attleboro	54.6	324.8
Stoughton with trestle	17.6	456.9
Stoughton-Whittenton with trestle	17.7	464.1
Stoughton at grade	17.6	467.1
Stoughton-Whittenton at grade	17.7	474.3

Results of the sensitivity analysis for three metrics, showing the range of expected results given the uncertainty in the effects of train traffic, are given in Table 5. Note that the ranking of the scenarios does not change under either the high or low traffic parameterization, and only the Attleboro route shows more than a very slight change in

percent as compared to the worst-case scenario. The sensitivity analysis suggests that our uncertainty in parameterizing traffic effects of railroads has only a minor effect on the results. (Note that these losses are not directly comparable with those in Table 3, because the sensitivity analysis only takes three metrics into account.)

Table 5. Results of sensitivity analysis for three metrics (connectedness, similarity, and traffic intensity), showing range of loss in acres and loss in terms of percent of worst-case scenario for each scenario, given uncertainty in equivalent traffic rates of trains.

	Loss in IEI units		Range in percent	
Scenario	**Minimum**	**Maximum**	**Minimum**	**Maximum**
Base	0.0	0.0	0.0	0.0
Attleboro	325.5	367.9	82.5	71.2
Stoughton with trestle	379.6	500.5	96.2	96.9
Stoughton-Whittenton with trestle	384.6	506.8	97.5	98.1
Stoughton at grade	390.0	510.4	98.8	98.8
Stoughton-Whittenton at grade	394.6	516.7	100.0	100.0

The bulk of the effect of these scenarios is reflected in three metrics: connectedness, similarity, and traffic intensity. Connectedness, with its broader scale and integration of landscape resistance, is the most relevant single metric. Images of connectedness deltas are shown for four focal areas: Assonet Swamp (Fig. 4), Hockomock Swamp (Fig. 5), Pine Swamp (Fig. 6), and the Attleboro Bypass area (Fig 7). Note that the color gradient used in these four figures are the same, thus they are visually comparable.

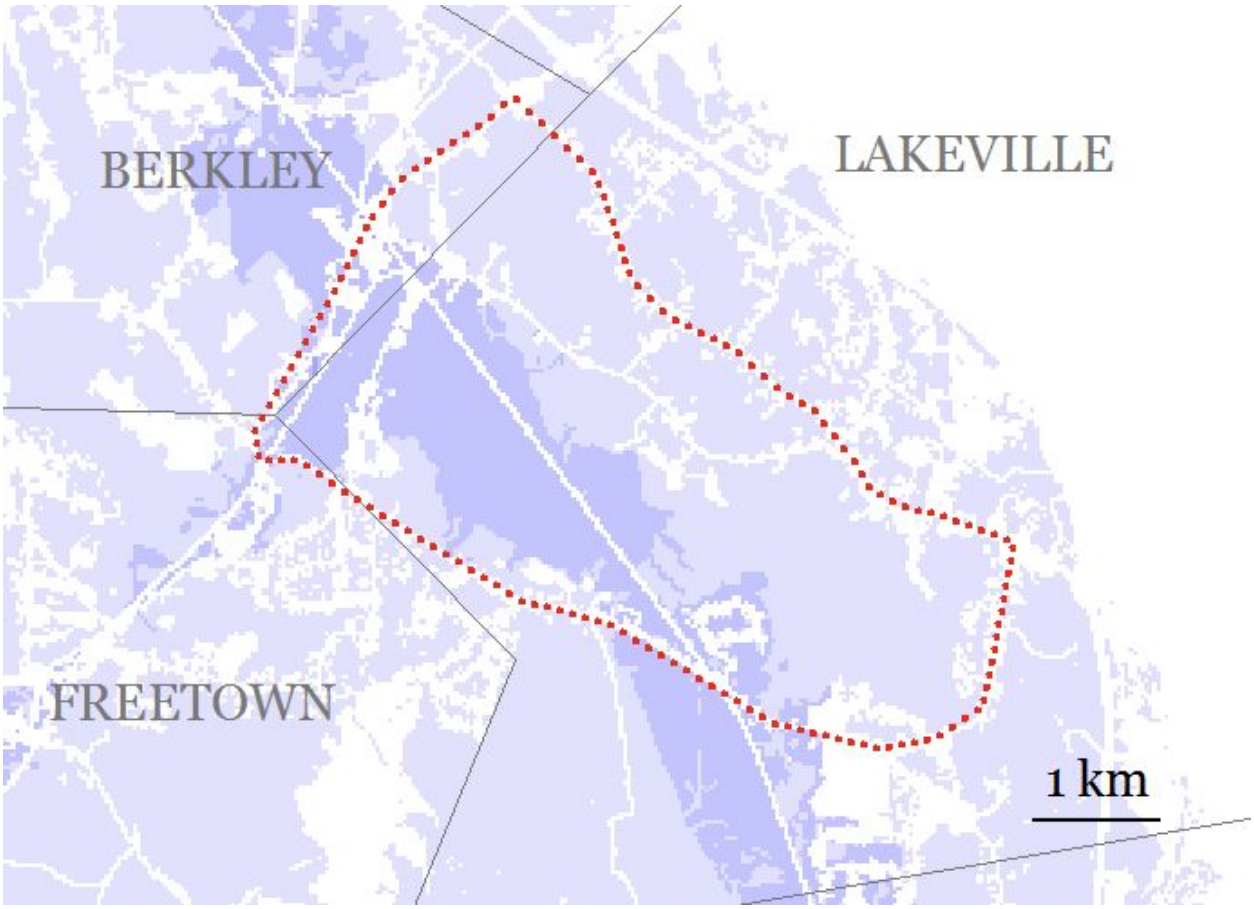

Fig. 4. Connectedness delta (darker areas = higher loss) for Assonet Swamp focal area for all scenarios. Note that color gradient is scaled the same for Figs. 4-7.

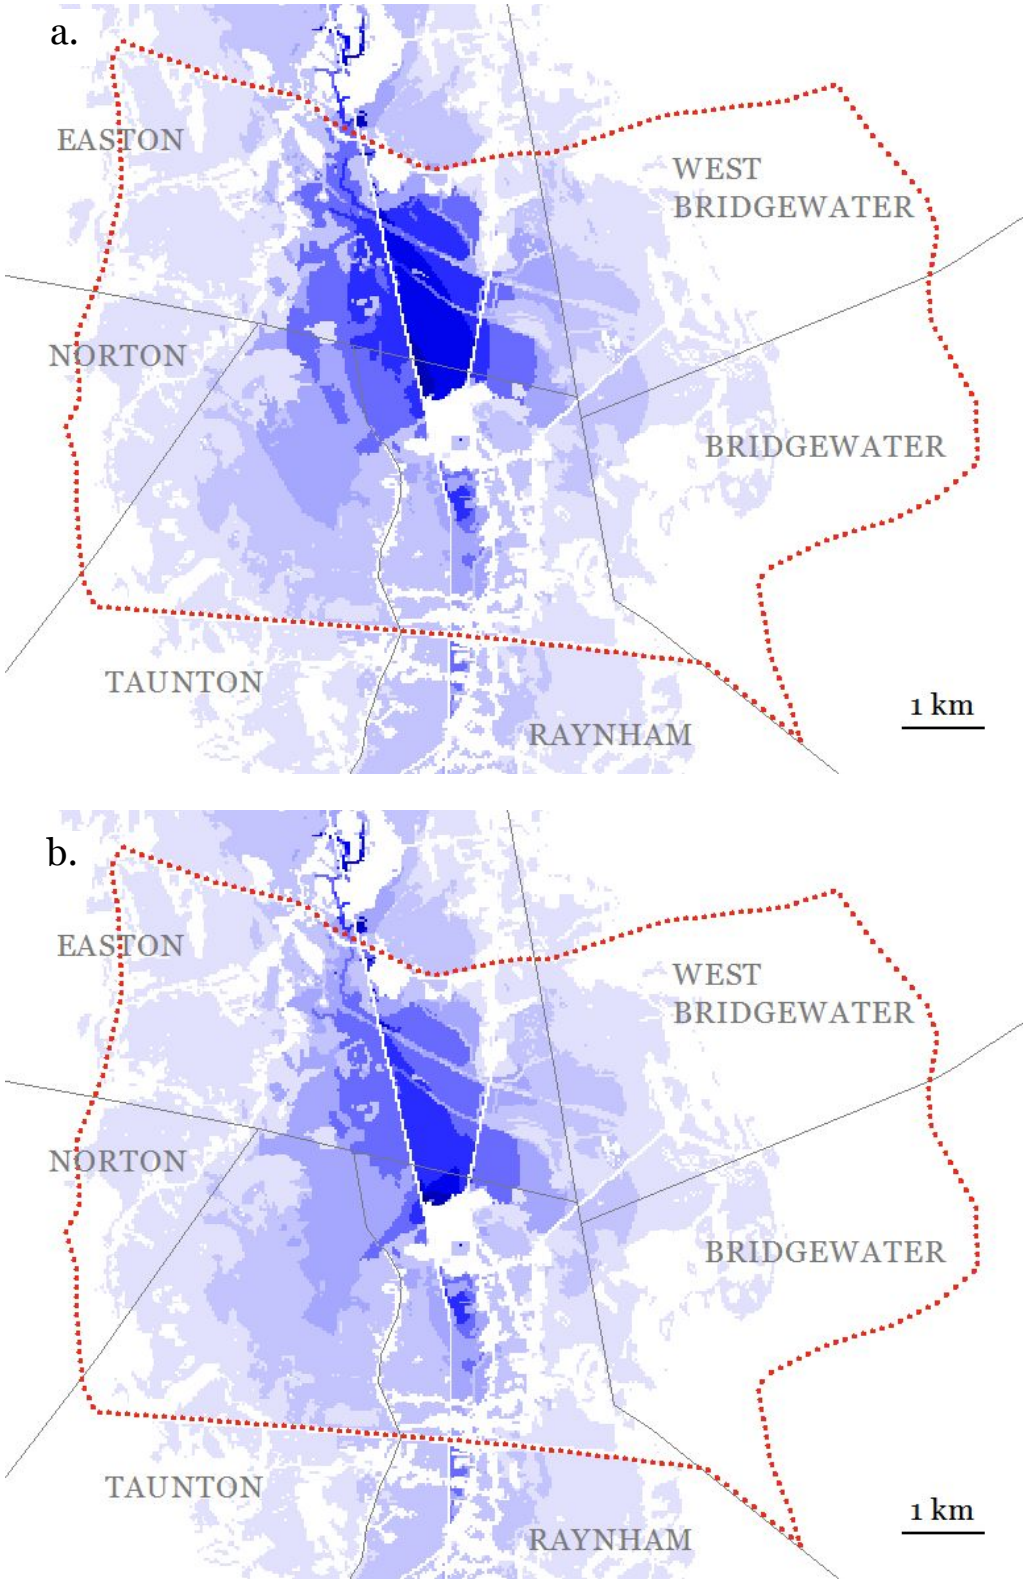

Fig. 5. Connectedness delta (darker areas = higher loss) for Hockomock Swamp focal area for (a) Stoughton at grade, and (b) Stoughton with trestle. The Stoughton and Stoughton-Whittenton scenarios are the same within Hockomock Swamp.

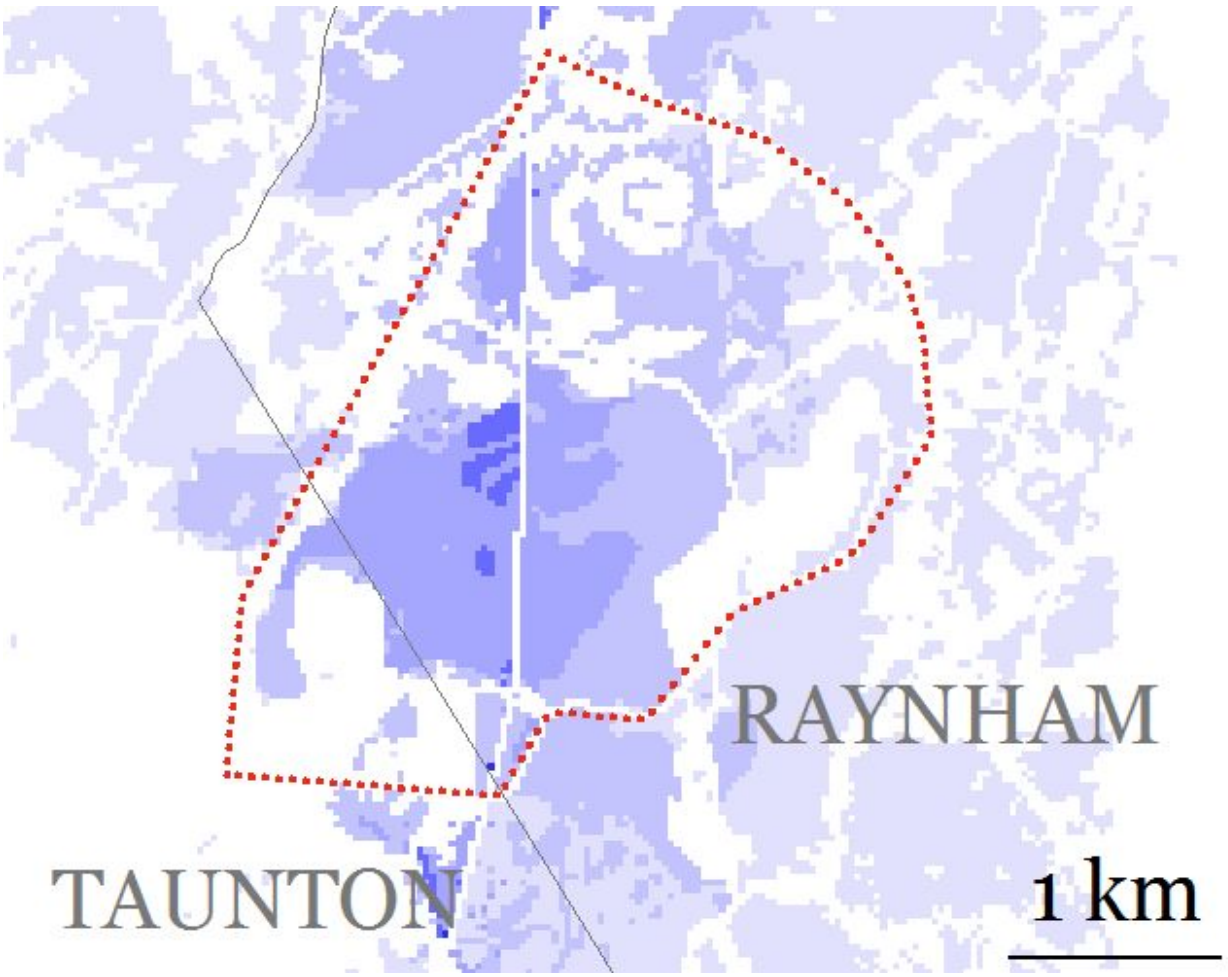

Fig. 6. Connectedness delta (darker areas = higher loss) for Pine Swamp focal area for Stoughton scenarios.

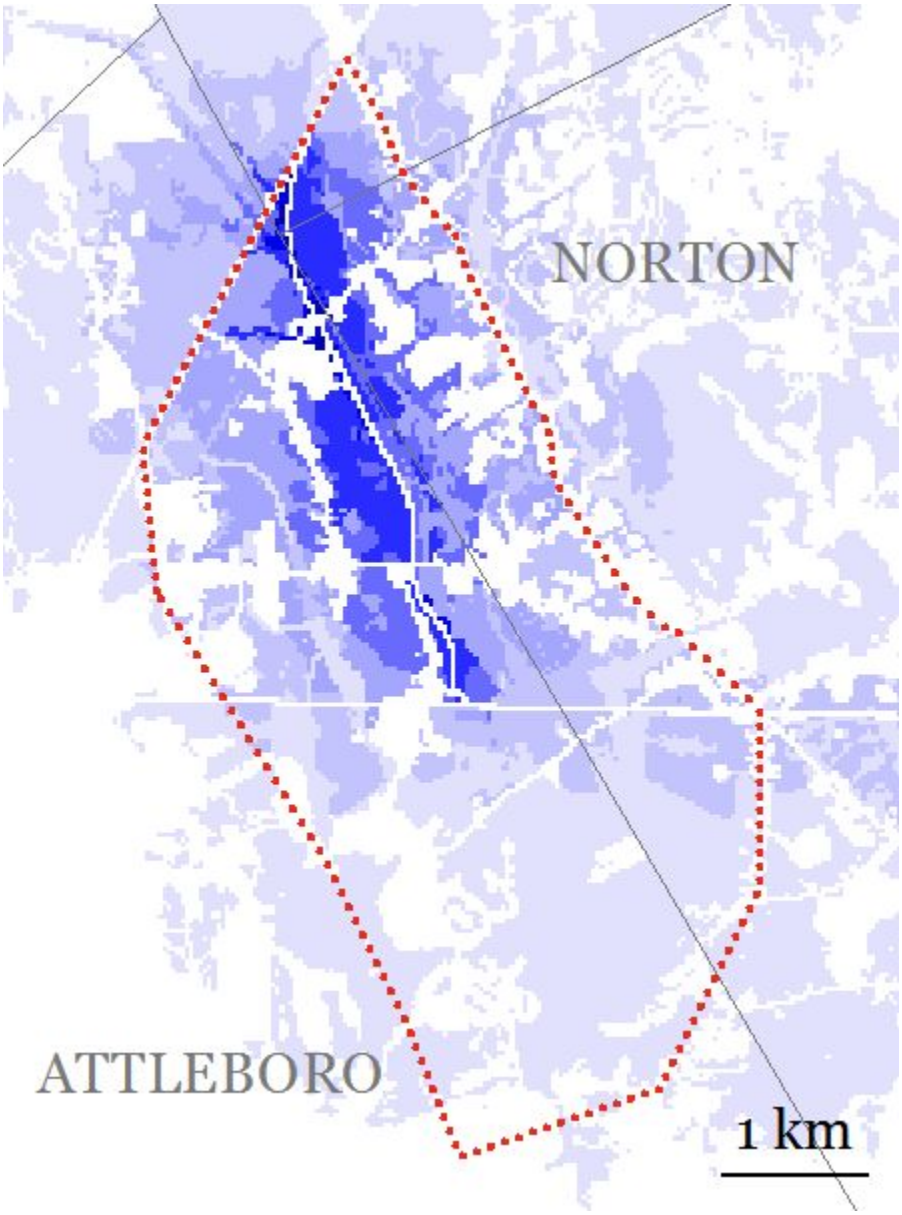

Fig. 7. Connectedness delta (darker areas = higher loss) for Attleboro bypass focal area for the Attleboro scenario.

Appendix A: Land cover classes

Land cover classes are listed below, with numeric codes for each class. New classes added for the South Coast Rail project are italicized.

Developed

1 Cropland
5 Mining
7 Participatory recreation
8 Spectator recreation
9 Water based recreation
10 Multi-family residential
11 High-density residential
12 Medium-density residential
13 Low-density residential
15 Commercial
16 Industrial
17 Urban open
18 Transportation
19 Waste disposal
26 Golf
29 Marina
31 Urban public
34 Cemetery
35 Orchard
36 Nursery
39 Junkyard
41 Train station
61 Large dam
62 Medium dam
63 Small dam
64 Tiny dam
71 Expressway
72 Primary highway
73 Secondary highway
74 Light duty road
75 Unpaved road
77 Rail trail
78 Abandoned railbed no tracks
79 Abandoned rail with tracks
81 Train (freight)
82 Train (passenger)
83 Train (commuter)
84 Train (freight + passenger)
85 Train (freight + commuter)
86 Train (passenger + commuter)
87 Train (freight + passenger + commuter)
88 Train (trestle)
89 Train (retaining wall)
91 Bridge
92 Culvert

Terrestrial

102 Pasture
103 Forest
106 Open land
124 Powerlines
151 Sea cliff
152 Barrier beach system
156 Coastal dune
167 Barrier beach coastal beach
169 Barrier beach coastal dune
191 Deciduous forested wetland
192 Mixed forested wetland
193 Coniferous forested wetland

Palustrine

331 Pond
354 Bog
355 Cranberry bog
357 Deep marsh
358 Shallow marsh
362 Shrub swamp
396 Vernal pool

Riverine

411 First order flatwater
412 First order pool-riffle
413 First order plane-bed
414 First order step-pool
415 First order cascade
421 Second order flatwater
422 Second order pool-riffle

423 Second order plane-bed
424 Second order step-pool
425 Second order cascade
431 Third order flatwater
432 Third order pool-riffle
433 Third order plane-bed
434 Third order step-pool
435 Third order cascade
441 Fourth order flatwater
442 Fourth order pool-riffle
443 Fourth order plane-bed
444 Fourth order step-pool
445 Fourth order cascade
451 Fifth order flatwater
452 Fifth order pool-riffle
453 Fifth order plane-bed
454 Fifth order step-pool
455 Fifth order cascade
461 Sixth order flatwater
462 Sixth order pool-riffle
463 Sixth order plane-bed
464 Sixth order step-pool
465 Sixth order cascade

Lacustrine
532 Lake
581 Reservoir

Estuarine
621 Salt pond
622 Bay
652 Barrier beach pond
661 Salt marsh
668 Barrier beach bog
670 Barrier beach deep marsh
671 Barrier beach marsh
673 Barrier beach shrub swamp
674 Barrier beach deciduous forested wetland
675 Barrier beach coniferous forested wetland
676 Barrier beach mixed forested wetland
677 Barrier beach salt marsh

683 Third order estuary
684 Fourth order estuary
685 Fifth order estuary
686 Sixth order estuary

Marine
753 Coastal beach
760 Rocky intertidal
763 Tidal flat
790 Ocean

Appendix B: Input Data Layers

Note: changes from the 2009 preliminary Massachusetts run are denoted with change bars.

Nonforested Uplands – Three of these communities came from the MassGIS 2005 Land Use: pasture, powerlines, and open land (formerly called old fields in CAPS).

Wetlands – We used Massachusetts DEP Wetlands. DEP wetlands were photo-interpreted, and are generally of high quality, although beaver pond disturbance/succession has introduced many "errors," most commonly current shrub swamps mapped as forested wetland. Note that many new coastal wetlands have been added for this run.

Vernal Pools – We used Potential Vernal Pools from MassWildlife's Natural Heritage and Endangered Species Program. Potential vernal pools that fell within a terrestrial type were treated as a single pixel pool (30 m × 30 m). When a potential vernal pool fell within a wetland mapped by DEP, we retained DEP's classification. We added a number of vernal pools and dropped one spurious PVP in the vicinity of proposed rail lines based on surveys by NHESP.

Streams and Rivers – Streams and rivers are based on our work for Natural Heritage and Endangered Species Program's Living Waters project. MassGIS 1:25k stream centerlines were used to define streams. Streams are classified by order and gradient. Order is calculated from the stream centerline data; and gradient is based on the digital elevation model. We identified rivers that flow into the state to correct the order of these stream networks. For rivers wider than 30 m, the open water class from Land Use was used to represent the entire river basin, and the class based on order and gradient was applied to the entire width.

Developed Land – Developed land comes directly from the MassGIS 2005 Land Use. Proposed rail stations were added from SCR data.

Dams – Dams (in four size classes) were developed in collaboration with DEP and Mass Riverways as part of Natural Heritage's Living Waters project. Dams were derived from a MassDEP point shapefile and digitized as lines over stream centerlines overlaid on the MassGIS 1 meter, 1:5000 black and white orthophotos. Dams are treated as a developed type.

Roads and Railroads – Roads are railroads are from MassGIS's 1:25k EOT roads and trains layers. Roads were reclassified into five types based on original road classes as well as surface type (for unpaved roads). We also used interpolated traffic rates from the EOT roads layer. Railroads from MassGIS were mapped in several classes: abandoned railbed without tracks, rail trail, and combinations of freight, passenger, and commuter rail. Additional rail types were mapped for various scenarios from SCR data, including abandoned railbed with tracks, proposed commuter rails, commuter rail on trestle, and

commuter rail with retaining walls. Rail traffic rates were based on an estimated number of trains per day and cars per train.

Elevation – A digital elevation model (DEM) was created by David Goodwin of the UMass Resource Mapping Unit from MassGIS digital terrain model (DTM) elevation contours, elevation points, and topographic breaklines as part of the Living Waters project.

Flow – A flow grid (giving the direction of expected water flow for each cell) based on a digital elevation model was created for all of mainland Massachusetts by our lab as part of the Living Waters project. This flow grid conforms to MassGIS centerline data. We used this flow grid directly.

Aquatic Resistance – We modified the approach of Randhir et al. 2001 (Forest Ecology and Management 143:47-56) to build a time-of-travel grid for each cell in the project area, based on land cover, slope, flow, and stream gradient. This grid was used to define the influence area within the watershed of each point for our watershed metrics.

Point-source Pollution – Point-source pollution was defined by Massachusetts Natural Heritage and Endangered Species Program as part of their Living Waters project. These data are based on an assessment of pollution risk compiled from six DEP and EPA data layers: TRI (Toxic Release Inventory), RCRIS (Resource Conservation and Recovery Information), PCS (Permit Compliance System), MINES (Mineral Industry Locations), IFD (Industrial Facility Discharge Sites), and CERCLIS (Superfund National Priority List Sites) from the EPA Basins 3.0 website (http://www.epa.gov/waterscience/basins/metadata.htm). UST (Underground Storage Tank Locations), GRWTR (Ground Water Discharge Permits), and DEP Solid Waste Facilities point sources are available from MassGIS. See Heritage's Living Waters Technical Report for details.

Imperviousness – Impervious surfaces are from MassGIS. This layer is at 1 m resolution, based on the 2005 orthophotos. Imperviousness is summarized as percent impervious in 30 m cells.

Appendix C: CAPS integrity metrics

These ecological integrity metrics are included in the Conservation Assessment and Prioritization System (CAPS). Integrity metrics include both anthropogenic *stressor* metrics that measure the level of anthropogenic activities exclusively and *resiliency* metrics that measure the combined effect of anthropogenic stressor and landscape context.

Stressor Metrics	
Development & roads	
Habitat loss	Measures the intensity of habitat loss caused by all forms of development in the neighborhood surrounding the focal cell, based on a logistic function of Euclidean distance.
Wetland buffer insults	Measures the adverse effect of impervious surfaces within the 100-foot regulatory buffer around a wetland.
Traffic	Measures the intensity of road and rail traffic (based on measured road traffic rates) in the neighborhood surrounding the focal cell, based on a logistic function of distance.
Microclimate alterations	Measures the adverse effects of induced (human-created) edges on the microclimate of patch interiors, such as moisture, temperature, and wind. The edge effects metric is based on the "worst" edge effect among all adverse edges in the neighborhood surrounding the focal cell, where each adverse edge is evaluated using a "depth-of-edge" function in which the "effect" is scaled using a logistic function of distance.
Pollution	
Road salt	Measures the intensity of road salt application in the watershed above an aquatic focal cell weighted by road class and the modeled "influence value" for each cell, which is the aquatic distance from the focal cell based on a time-of-flow model. This metric is a surrogate for road salt application rates.

Sedimentation	Measures the intensity of road sediment production in the watershed above an aquatic focal cell weighted by road class (i.e., size, substrate, gradient) and the modeled "influence value" for each cell, which is the aquatic distance from the focal cell based on a time-of-flow model. This metric is a surrogate for road sediment production rates.
Nutrient loading	Measures the intensity of fertilizer application in the neighborhood surrounding the focal cell, based on the aquatic distance from the focal cell based on a time-of-flow model to development classes (primarily agriculture and residential land uses). This metric is a surrogate for fertilizer application rate.
Toxic pollution	Measures the intensity of actual or potential point-sources of pollution (such as permitted discharges into streams, municipal and industrial sewage plants, and underground storage tanks) in the watershed above an aquatic focal cell, weighted by type and size of point source and by the modeled "influence value" for each cell, which is the aquatic distance from the focal cell based on a time-of-flow model.
Biotic alterations	
Domestic predators	Measures the intensity of development associated with sources of domestic predators (e.g., cats) in the neighborhood surrounding the focal cell, based on a logistic function of distance to development classes. This metric is a surrogate for domestic predator abundance measured directly in the field.
Edge predators	Measures the intensity of development associated with sources of human commensal mesopredators (e.g., raccoons and skunks) and nest parasites (cowbirds) in the neighborhood surrounding the focal cell, based on a logistic function of distance to development classes. This metric is a surrogate for mesopredator/nest parasite abundance measured directly in the field.
Non-native invasive plants	Measures the intensity of development associated with sources of non-native invasive plants in the neighborhood surrounding the focal cell, based on a logistic function of distance to development classes. This metric is a surrogate for non-native invasive plant abundance measured directly in the field.

Non-native invasive earthworms	Measures the intensity of development associated with sources of non-native invasive earthworms in the neighborhood surrounding the focal cell, based on a logistic function of distance to development classes. This metric is a surrogate for non-native invasive earthworm abundance measured directly in the field.
Hydrological alterations	
Imperviousness	Measures the intensity of impervious surface in the watershed above the focal cell, based on imperviousness and the modeled "influence value" for each cell, which is the aquatic distance from the focal cell based on a time-of-flow model.
Percent impounded	Measures the proportion of the watershed above an aquatic focal cell that is impounded by dams, weighted by the modeled "influence value" for each cell, which is the aquatic distance from the focal cell based on a time-of-flow model.
Upstream road crossings	Measures the number of upstream road crossings per kilometer of stream above an aquatic focal cell weighted by the modeled "influence value" for each cell, which is the aquatic distance from the focal cell based on a time-of-flow model.
Dam intensity	Measures the number of dams in the watershed above an aquatic focal cell weighted by dam size and the modeled "influence value" for each cell, which is the aquatic distance from the focal cell based on a time-of-flow model.

Resiliency Metrics	
Connectedness	Measures the disruption of habitat connectivity caused by all forms of development between each focal cell and surrounding cells as well as the "resistance" of the surrounding undeveloped landscape. A hypothetical organism in a highly connected cell can reach a large area with minimal crossing of "hostile" cells. This metric uses a least-cost path algorithm to determine the area that can be reached from each focal cell. The focal cell gets a "bank account," which represents the distance a hypothetical organism could move through the undeveloped landscape. Each cell is assigned a travel cost, based on a resistance matrix, as a function of its ecological similarity to the focal cell. The algorithm then creates a least-cost hull around the focal cell, representing the maximum distance that can be moved from the cell until the "bank account" is depleted.
Similarity	Measures the amount of similarity between the ecological setting at the focal cell and those of neighboring cells, weighted by a logistic function of distance. Similarity is based on the ecological distance between the focal cell and each neighboring cell, where ecological distance is a multivariate distance across all ecological setting variables.

Appendix D: Metric Parameterizations

This table gives relative weights for each metric by community.

	Development & roads	Habitat loss	Watershed habitat loss	Wetland buffer insults	Road traffic	Microclimate alterations	Pollution	Road salt	Sedimentation	Nutrient loading	Toxic pollution	Biotic alterations	Domestic predators	Edge predators	Non-native invasive plants	Non-native invasive earthworms	Hydrological alterations	Imperviousness	Percent impounded	Upstream road crossings	Dam intensity	Resiliency metrics	Connectedness	Similarity
Terrestrial																								
Forest		2			2	1							1	2	2	2							5	3

Appendix E: GIS Data Directory

This appendix lists all GIS data provided on our FTP site. Each directory is supplied as a .zip file. All data are Arc/Info grids unless otherwise noted.

Grids listed with a trailing dash are provided for each scenario; for instance, iei- refers to grids named ieiX (base scenario), ieiA (Attleboro alternative), etc. Grids for sensitivity analyses are not provided.

Landcover grids (landcover.zip)

landcover\flc-	Landcover map, including roads and streams

Final results (final.zip)

final\iei-	Index of Ecological Integrity
final\delta-	Difference grids from base for each scenario

Scaled landscape metric* results (scaled.zip)

scaled\...	Rescaled landscape metric results

Raw landscape metric* results (raw.zip)

raw\...	Raw (unscaled) landscape metric results

Indirect loss for each landscape metric* (deltas.zip)

deltas\...	Raw (unscaled) landscape metric results

* For a list of landscape metrics and their corresponding grid names, see *CAPS Landscape Metrics*, below.

CAPS Landscape Metrics

The following grids are supplied in the \results folder, both in raw and scaled forms. Raw metrics are the original, unscaled results. Scaled metrics are rescaled by percentiles within each community, thus values of "connect" ≥ 0.90 represent the 10% best locations for connectedness for each community. These scaled metrics were combined using the weights listed in Appendix C to create the final Indices of Ecological Integrity. Note that watershed-based metrics were the same across all scenarios.

Grid name	Landscape metric
Development & roads	
habloss-	Habitat loss
whabloss	Watershed habitat loss
insults	Wetland buffer insults
traffic-	Road traffic
edges-	Microclimate alterations
Pollution	
salt	Road salt
sediment	Sedimentation
fertilize	Nutrient loading
pointsource	Toxic pollution
Biotic alterations	
cats-	Domestic predators
edgepred-	Edge predators
badplants-	Non-native invasive plants
worms-	Non-native invasive earthworms
Hydrological alterations	
imperv	Imperviousness
impound	Percent impounded
roadx	Upstream road crossings
damint	Dam intensity
Resiliency metrics	
connect-	Connectedness
sim-	Similarity

RE: Project Location: South Coast Rail (New Bedford/ Fall River Commuter Rail Extension)
Town: Various
NHESP Tracking No.: 98-3735

To Whom It May Concern:

Thank you for contacting the Natural Heritage and Endangered Species Program ("NHESP") of the MA Division of Fisheries & Wildlife for information regarding state-listed rare species in the vicinity of the above referenced site. Based on the information provided, this project site, or a portion thereof, is located **within** *Priority Habitat* (PH) and *Estimated Habitat* (EH) as indicated in the *Massachusetts Natural Heritage Atlas* (13th Edition). Our database indicates that the following state-listed rare species have been found in the vicinity of the site:

Priority Habitat 1392 (PH 1392) and *Estimated Habitat 59* (EH59):

Scientific name	Common Name	Taxonomic Group	State Status
Ambystoma laterale	Blue-Spotted Salamander	Amphibian	Special Concern
Emydoidea blandingii	Blanding's Turtle	Reptile	Threatened
Terrapene carolina	Eastern Box Turtle	Reptile	Special Concern

Priority Habitat 1392 (PH 1392):

Scientific name	Common Name	Taxonomic Group	State Status
Lycopus rubellus	Gypsywort	Plant	Endangered

Priority Habitat 1421 (PH 1421) and *Estimated Habitat 36* (EH36):

Scientific name	Common Name	Taxonomic Group	State Status
Enallagma recurvatum	Pine Barrens Bluet	Damselfly	Threatened
Glyptemys insculpta	Wood Turtle	Reptile	Special Concern
Pseudemys rubriventris pop 1	Northern Red-Bellied Cooter	Reptile	Endangered
Terrapene carolina	Eastern Box Turtle	Reptile	Special Concern

Priority Habitat 1421 (PH 1421):

Scientific name	Common Name	Taxonomic Group	State Status
Ammodramus savannarum	Grasshopper Sparrow	Bird	Threatened
Eleocharis tricostata	Three-Angled Spike-Sedge	Plant	Endangered
Sabatia kennedyana	Plymouth Gentian	Plant	Special Concern

Priority Habitat 1349 (PH 1349) and *Estimated Habitat 1* (EH 1):

Scientific name	Common Name	Taxonomic Group	State Status
Lithophane viridipallens	Pale Green Pinion Moth	Butterflies and Moths	Special Concern
Papaipema sulphurata	Water-Willow Stem Borer	Butterflies and Moths	Threatened
Synurella chamberlaini	Coastal Swamp Amphipod	Crustacean	Special Concern
Terrapene carolina	Eastern Box Turtle	Reptile	Special Concern

Priority Habitat 1093 (PH 1093) and *Estimated Habitat 951* (EH 951):

Scientific name	Common Name	Taxonomic Group	State Status
Callophrys hesseli	Hessel's Hairstreak	Butterflies and Moths	Special Concern
Glyptemys insculpta	Wood Turtle	Reptile	Special Concern
Somatochlora linearis	Mocha Emerald	Dragonfly	Special Concern
Terrapene carolina	Eastern Box Turtle	Reptile	Special Concern

Priority Habitat 620 (PH 620) and *Estimated Habitat 545* (EH 545):

Scientific name	Common Name	Taxonomic Group	State Status
Ambystoma opacum	Marbled Salamander	Amphibian	Threatened

Priority Habitat 1297 (PH 1297) and *Estimated Habitat 1077* (EH 1077):

Scientific name	Common Name	Taxonomic Group	State Status
Callophrys hesseli	Hessel's Hairstreak	Butterflies and Moths	Special Concern

Priority Habitat 12 (PH 12) and *Estimated Habitat 73* (EH 73):

Scientific name	Common Name	Taxonomic Group	State Status
Emydoidea blandingii	Blanding's Turtle	Reptile	Threatened

Priority Habitat 12 (PH 12):

Scientific name	Common Name	Taxonomic Group	State Status
Scirpus longii	Long's Bulrush	Plant	Threatened

Priority Habitat 236 (PH 236) and *Estimated Habitat 121* (EH 121):

Scientific name	Common Name	Taxonomic Group	State Status
Emydoidea blandingii	Blanding's Turtle	Reptile	Threatened

Priority Habitat 1158 (PH 1158) and *Estimated Habitat 372* (EH 372):

Scientific name	Common Name	Taxonomic Group	State Status
* *Data Sensitive Species*			Endangered

Priority Habitat 1158 (PH 1158):

Scientific name	Common Name	Taxonomic Group	State Status
Panicum rigidulum ssp pubescens	Long-Leaved Panic-Grass	Plant	Threatened

Priority Habitat 298 (PH 298) and *Estimated Habitat 198* (EH 198):

Scientific name	Common Name	Taxonomic Group	State Status
Terrapene carolina	Eastern Box Turtle	Reptile	Special Concern

Priority Habitat 1439 (PH 1439) and *Estimated Habitat 948* (EH 948):

Scientific name	Common Name	Taxonomic Group	State Status
Glyptemys insculpta	Wood Turtle	Reptile	Special Concern

Priority Habitat 1239 (PH 1239):

Scientific name	Common Name	Taxonomic Group	State Status
Panicum rigidulum ssp pubescens	Long-Leaved Panic-Grass	Plant	Threatened

Priority Habitat 261 (PH 261) and *Estimated Habitat 153* (EH 153):

Scientific name	Common Name	Taxonomic Group	State Status
Terrapene carolina	Eastern Box Turtle	Reptile	Special Concern

Priority Habitat 229 (PH 229) and *Estimated Habitat 111* (EH 111):

Scientific name	Common Name	Taxonomic Group	State Status
* *Data Sensitive Species*			Endangered
* *Data Sensitive Species*			Endangered

Priority Habitat 454 (PH 454) and *Estimated Habitat 350* (EH 350):

Scientific name	Common Name	Taxonomic Group	State Status
Ambystoma opacum	Marbled Salamander	Amphibian	Threatened

Priority Habitat 451 (PH 451) and *Estimated Habitat 328* (EH 328):

Scientific name	Common Name	Taxonomic Group	State Status
Emydoidea blandingii	Blanding's Turtle	Reptile	Threatened

Priority Habitat 282 (PH 282) and *Estimated Habitat 179* (EH 179):

Scientific name	Common Name	Taxonomic Group	State Status
Terrapene carolina	Eastern Box Turtle	Reptile	Special Concern

Priority Habitat 924 (PH 924) and *Estimated Habitat 753* (EH 753):

Scientific name	Common Name	Taxonomic Group	State Status
Sterna hirundo	Common Tern	Bird	Special Concern
Sterna dougallii	Roseate Tern	Bird	Endangered

Priority Habitat 926 (PH 926) and *Estimated Habitat 755* (EH 755):

Scientific name	Common Name	Taxonomic Group	State Status
Sterna hirundo	Common Tern	Bird	Special Concern
Sterna dougallii	Roseate Tern	Bird	Endangered

Priority Habitat 1196 (PH 1196):

Scientific name	Common Name	Taxonomic Group	State Status
Scirpus longii	Long's Bulrush	Plant	Threatened

The species listed above are protected under the Massachusetts Endangered Species Act (MESA) (M.G.L. c. 131A) and its implementing regulations (321 CMR 10.00). State-listed wildlife are also protected under the state's Wetlands Protection Act (WPA) (M.G.L. c. 131, s. 40) and its implementing regulations (310 CMR 10.00). * These species are considered "Sensitive Species". They are highly susceptible to collection and are therefore of high concern to Natural Heritage. Information about these species (including presence/absence) can not be released to anyone (especially including release to third parties or published) unless such release is agreed to in writing by the Natural Heritage Program (See Massachusetts Public Records law: M.G.L. chapter 66 section 17D). Fact sheets for most state-listed rare species can be found on our website (www.nhesp.org).

This evaluation is based on the most recent information available in the NHESP database, which is constantly being expanded and updated through ongoing research and inventory. If you have any questions regarding this letter please contact Amy Coman, Endangered Species Review Assistant, at (508) 389-6364.

Sincerely,

Thomas W. French

P.O. Box 9151
Watertown, Massachusetts, 02471-9151

Dear Ms. Standley,

This is in response to your letter dated December 4, 2008 regarding the Exexcutive Office of Transportation and Public Works (EOT) proposed project to provide transportation from Boston to the cities of Fall River and New Bedford, Massachusetts. Five alternatives are being proposed. One alternative would require the reconstruction of freight rail bridges across the Taunton River in Taunton. Vanhasse Hangen Brustlin, INC. (VHB) has requested information on the presence of any species listed as threatened or endangered and any species of special concern by NOAA's National Marine Fisheries Service (NMFS).

No species listed by NMFS, inclusive of shortnose sturgeon, are present in the Taunton River. Atlantic sturgeon, however, are known to be present primarily during the summer months (i.e. June) at the mouth of the Taunton River, with occasional sturgeon occurring farther upstream. Atlantic sturgeon are considered a Candidate Species as NMFS has initiated a status review for this species to determine if listing as threatened or endangered under the ESA is warranted. A status review report was completed by the status review team in February 2007. NMFS is currently reviewing the report and other available information to determine if listing under the ESA is warranted. To date, our knowledge indicates that, although the Taunton River doesn't support a spawning population of Atlantic sturgeon, the system is used as a nursery area for Atlantic surgeon (Burkett and Kynard 1993)[1]. Juvenile and sub-adult Atlantic sturgeon two years of age and older have been documented within this river system and it is believed that juveniles remain in riverine and estuarine habitats for 1-6 years (Smith 1985)[2]. Although Atlantic sturgeon are known to be present in the Taunton River, as noted above the species generally occurs at the mouth of the river and as such, it is unlikely for Atlantic sturgeon to occur in the vicinity of your proposed project. As a result, no further coordination with NMFS

Protected Resources Division on the effects of the project on listed species is necessary. Should you have any questions about these comments please contact Danielle Palmer at (978)281-9300 ext. 6518 or by e-mail (Danielle.Palmer@noaa.gov).

Sincerely,

Mary A. Colligan
Assistant Regional Administrator
for Protected Resources

RE: South Coast Rail Project

Dear Ms. Adams,

The U.S. Army Corps of Engineers (USACE) is preparing to issue a Final Environmental Impact Statement for the Massachusetts' Department of Transportation's proposed South Coast Rail Project. This project would extend commuter rail service from South Station in Boston to Fall River and New Bedford. The proposed railway would cross the Taunton River in the City of Taunton, MA.

We have reviewed the proposed action and have determined that no species listed under our jurisdiction are likely to be exposed to any direct or indirect effects of the proposed project. Based on this, we do not believe a consultation in accordance with section 7 of the Endangered Species Act of 1973, as amended, is necessary. As such, NMFS Protected Resources Division does not intend to offer additional comments on this proposal. Should project plans change or new information become available that changes the basis for this determination, further coordination should be pursued. If you have any questions regarding these comments, please contact Julie Crocker of my staff (978-282-8480 or Julie.Crocker@noaa.gov).

Sincerely,

for Mary A. Colligan
Assistant Regional Administrator
for Protected Resources

Appendix 4.16-A

Secondary and/or Indirect Wetland Impact Assessment

SOUTH COAST RAIL

SCR SECONDARY and/or INDIRECT WETLAND IMPACT ASSESSMENT

Introduction

The Secretary's Certificate on the Draft EIR (June 29, 2011) stated that "The FEIR should expand upon the analysis of wetlands functions and values in the DEIR/S to include a more detailed analysis for the proposed Stoughton rail. The FEIR should include narrative descriptions of wetlands functions and values of each wetland impacted directly and indirectly by the proposed project. The mitigation plan should describe how the lost functions and values will be mitigated."

The EPA, in its comments on the DEIS/DEIR (May 27, 2011) stated that "The Region … is less concerned about secondary adverse impacts to adjoining wetlands and water bodies where there are existing active rail lines. In contrast, the Region is greatly concerned about secondary adverse impacts to aquatic resources along those portions of the Stoughton and Whittenton corridors where no embankment exists or where a narrow embankment has been abandoned for decades and the forest canopy now is mostly unbroken. Section 4.14 on Biodiversity, Wildlife and Vegetation, presents a thorough description and reasonable evaluation of secondary adverse impacts upon aquatic resources and wetland-dependent wildlife. Still, we believe that the evaluation is lacking adequate detail in a few areas.." Specific issues identified in the EPA letter include:

- *The FEIS should provide a more thorough and specific evaluation of the potential for adverse impacts from canopy clearing, especially across the Hockomock Swamp.*

- *Several types of environmental harm would result from the construction and operation of the Stoughton or Whittenton Alternatives. … The nature, extent, permanence, and severity of these types of secondary impacts need to be more fully evaluated in the FEIS.*

- *The Region seeks a variety of additional information about the extent, nature, and severity of direct and secondary adverse impacts to aquatic resources within the Stoughton and Whittenton rail corridors Until we have evaluated that additional information … we cannot reach conclusions regarding the significance of those adverse impacts and whether those alternatives could comply with section 230.10(c) of the section 404(b)(1) Guidelines.*

MassDOT has developed this methodology for Secondary and/or Indirect Wetland Impact Assessment in response to the requirements of the Certificate and the EPA's comments. A meeting of the Interagency Coordinating Group (ICG) wetland subgroup was held on May 4, 2012 to discuss this proposed methodology. The methodology, particularly the items in the checklist, was subsequently modified to incorporate agency comments.

Secondary and Indirect Impacts

Secondary (indirect) effects are defined in the EPA Regulations at 40 CFR Part 230.11. The EPA regulations state that "Secondary effects are effects on an aquatic ecosystem that are associated iwth a discharge of dredged or fill materials, but do not result from the actual placement of the dredged or fill material . "

Although not specifically addressing impacts to aquatic resources, the CEQ NEPA regulations at 40 CFR Part 1508.8 define indirect effects as ".. effects, which are caused by the action and are later in time or farther removed in distance, but are still reasonably forseeable. Indifect effects many include … related effects on air and water and other natural systems, including ecosystems". Although the

MEPA Regulations (314 CMR 11.00) require that an EIR assess potential indirect impacts on the environment, the regulations do not provide a definition.

Indirect impacts are therefore the consequences of an action's direct impacts. While the direct impact of filling a wetland would be the loss of the filled wetland area and the functions and values provided by that specific area, the indirect impacts of that wetland fill would result from the associated changes to the overall size of the wetland, hydrology, cover type, species assemblage, or degree of habitat fragmentation. These types of impacts could adversely affect the ability of the wetland to provide functions and values, or could diminish the functions and values to a degree greater than would be attributed simply due to the loss of area. Isolated fragments of wetlands or waterways may have reduced habitat value, no longer provide viable fish or wildlife habitat or be so isolated that the wetland or waterway fragments are rendered inaccessible to many fish or other aquatic species.

Section 404 jurisdiction over the South Coast Rail project is triggered by the direct discharge of fill material to waters of the United States (vegetated wetlands and water bodies). However, the Corps must consider the probable impacts, including cumulative impacts, of the proposed activity and its intended use, on the public interest. As stated in 33 CFR Section 320.4, permits can only be issued by the Corps if the discharge complies with the Environmental Protection Agency's 404(b)(1) Guidelines. The criteria for evaluating adverse effects (40 CFR 230.10(c), and further elaborated in Subpart D, Section 230.32)) under these guidelines include:

- Significant adverse impacts on …wildlife and special aquatic sites;
- Significant adverse effects on aquatic life and other wildlife dependent on aquatic ecosystems outside of the disposal site ;
- Significant adverse effects of the discharge on aquatic ecosystem diversity, productivity and stability.

For this analysis, indirect (secondary) impacts to wetlands and other waters of the United States include the following effects which could be caused by the placement of fill within jurisdictional wetlands, but occur at a different location or time:

- Changes in wetland functions; or
- Changes in wetland physical/biological characteristics as a result of the direct impacts (loss of wetland).

The types of direct impacts and the indirect impacts that may result include:

- Filling a portion of a wetland (loss of) – reduction in wetland size, Introducing human activity (noise, disturbance);
- Dredging a wetland/pond – change in hydrology, vegetation, habitat;
- Constructing a berm across a wetland – change in hydrology, fragmentation, introduction of disturbed non-wetland conditions, creation of new "edge", interrupt migratory routes;
- Installing a new culvert or changing existing culvert – alter water levels or flow patterns;
- Removing canopy or other vegetation – change light regimes, water temperature, plan community structure;

- Relocating a stream – change flow characteristics; or
- A new discharge of stormwater - alter water levels or flow patterns, or introduce sediments or nutrients.

In addition, the Massachusetts Wetlands Protection Act regulates work within 100 feet of a bordering vegetated wetland based on the presumption that work in close proximity to a wetland may alter the wetland such that its ability to protect the eight Interests of the Act are adversely affected. The Interests of the Act include the protection of public or private water supply, ground water supply, flood control, storm damage prevention, prevention of pollution, protection of land containing shellfish, protection of fisheries, and protection of wildlife habitat. "Alter" is defined in the WPA regulations at 310 CMR 10.04 as

> "to change the condition of any Area Subject to Protection under MGL c. 131, section 40. Examples of alterations include, but are not limited to, the following:
>
> (a) The changing of pre-existing drainage characteristics, flushing characteristics, salinity distribution, sedimentation pattners, flow patterns, and flood retention areas;
>
> (b) The lowering of the water level or water table;
>
> (c) The destruction of vegetation;
>
> (d) The changing of water temperatures, biochemical oxygen demand, and other physical, biological or chemical characteristics of the receiving water."

Geographic Limits of the Analysis

At the meeting, several agency representatives asked that the impact analysis look at wetlands that were more than 100 feet from the right-of-way, and cited studies associated with the Vermont Circumferential Highway that required analysis of the secondary and/or indirect effects of a highway at least 300 feet from the roadway. Subsequent to that meeting, the MassDOT team reviewed the available literature to determine an appropriate geographic limit for the evaluation of secondary and/or indirect impacts to aquatic resources.

There are numerous published studies that document that road construction may adversely affect the hydrology of wetlands upstream and downstream of a new road, and may adversely affect the movement of nutrients, sediment, or wildlife between wetlands (see Biglin, K. and A. Dupigny-Giroux, 2006; Fahrig, L. and T. Rytwinski, 2009; Forman, R.T. and R. D. Deblinger, 2000; Forman, R.T., D. Sperling, J.A. Bissonette, A. P. Clevenger, C.D. Cutshall, V.H. Dale, L. Fahrig, R. France, C.R. Goldman, K. Heanue, J.A. Jones, F.J. Swanson, T. Turrentine, T. C. Winter, 2003; Trombulak, S. C. and C. A. Frissell. 2000; and references cited therein). For newly constructed roads, these effects have been documented to extend 200 to 300 meters from the road. Other studies have focused on the effects of roads, particularly highways, on wetland-dependent wildlife (Eigenbrod et. A. 2009; Forman et al., 2003) and have shown that roads have adverse effects on aquatic wildlife populations as a result of loss of habitat (directly or because roads prevent access to habitat) or as a result of noise, particularly for multi-lane major highways. Forman and Deblinger (2000) coined the phrase "Road-Effect Zone" for the combined area of highway-related secondary and/or indirect effects to natural ecosystems, and considered (based on research by others) that 300 meters was the maximum distance that ecological effects would occur from a highway. Subsequent studies have shown that highway effects are highly

species-specific (Eigenbrod et al.. 2009) and are correlated with the width of the highway, the volume of traffic, and the night/day traffic distribution.

As discussed in the Biodiversity Technical Report, there are few if any studies of the effects of railroads on wildlife, and we were unable to find any published studies of the effects of railroads on aquatic ecosystems. The South Coast Rail project is not comparable to any of the studies of road effects. The entire project uses a railroad bed that was constructed across wetlands in the 1880s. While the effects of new construction of a railroad through wetlands would be comparable to the new construction of a road or highway across wetlands, any hydrological effects on wetlands occurred following construction and have been stable for a century. The replacement of existing culverts, designed according to modern careful standards for stream crossings, will not require any stream channelization and will maintain existing hydrology. Connectivity between wetlands, particularly for fish and small vertebrates that use culverts, would improve.

Railroads do not generate the severe, constant noise levels that are characteristic of a highway. As documented in the Biodiversity Technical Report, on the Southern Triangle (New Bedford Main Line and Fall River Secondary), any given point will experience 20 train pass-bys per day, for an average of 6 seconds per pass. The number of train pass-bys would be 40 per day between Stoughton and Myricks Junction.

On the basis of this review of the literature and a solid understanding of the construction and operations of the South Coast Rail corridor, in comparison to the road-effects of new road construction or the road-effects of an operating highway, we conclude that there is no scientific basis for considering the South Coast Rail's "road-effect zone" for impacts to aquatic resources to extend further than 100 feet from the right-of-way. The sole exception to this conclusion would be restricted to the out-of-service section of the Stoughton Line where there are currently no barriers to the movement of small aquatic vertebrates (vernal pool amphibians, frogs, and turtles) across the railroad embankment. Reconstructing the railroad would introduce a barrier to the movement of such vertebrates and would reduce the area of available habitat, as discussed in the *Biodiversity Technical Report*. The "railroad-effect zone" for such wetland-dependent species could extend to 750 feet from the ROW. These impacts are documented in the *Biodiversity Technical Report*.

Methodology

Indirect (and/or Secondary) impacts to wetlands will be assessed for each within 100 feet of the Stoughton Line between Brock Street in Stoughton and the terminal stations in New Bedford and Fall River, and along the Whittenton Branch from Route 138 in Raynham to the Attleboro Secondary in Taunton, based on the functions and values that the wetland provides and the type and extent of the direct wetland impact and/or work adjacent to the wetland that is the cause of the secondary impact. This is a stepwise process that includes:

- For each wetland, identify the type of direct impact:
  - Loss of wetland area due to placement of fill
  - New culvert
  - Replacement of existing culvert
  - Other
  - Direct discharge of untreated stormwater from a pollutant source

- For each wetland, identify the type of work occurring within 100 feet of the wetland:
  - Improvement of existing freight or commuter rail tracks and increased train service
  - Replacement of track infrastructure on out-of-service rail and addition of train service
- Evaluate secondary and/or indirect impacts based on function-specific considerations using the attached checklist, and
- Provide a summary paragraph for each wetland.

The list of potential effects on functions and values is based on the "considerations and qualifiers" for each wetland function and value, as presented in the Corps of Engineers' "*Highway Methodology Workbook Supplement – Wetland Functions and Values, a Descriptive Approach*" (September 1999). These characteristics are identified in the *Supplement* as the principal characteristics which contribute to the ability of each wetland to provide the indicated function or value. If the direct wetland impact of the proposed action altered these characteristics, it is presumed to alter the ability of the wetland to continue to provide these functions.

SOUTH COAST RAIL

SCR WETLAND INDIRECT IMPACTS CHECKLIST

Indirect Impacts to Massachusetts Wetlands – does the work in the buffer zone or direct wetland impact alter the wetland by:

- Changing drainage characteristics or flow patterns
- Changing water levels
- Altering vegetation (outside of the direct impact area)
- Changing the temperature or biochemical characteristics of a stream or other waterbody

Groundwater Recharge/Discharge – does the direct impact to an aquatic resource, or work in uplands immediately adjacent to the wetland:

- Result in the loss of gravel or sandy soils present in or adjacent to the wetland
- Eliminate or reduce the association of the wetland with a perennial or intermittent watercourse
- Eliminate the defined or constricted outlet of the wetland
- Change the volume of water reaching the wetland via infiltration or surface runoff
- Reduce water quality within the wetland

Floodflow Alteration – does the direct impact to an aquatic resource, or work in uplands immediately adjacent to the wetland:

- Reduce the hydric soils which are able to absorb and detain water
- Change the constricted outlet (ability of the wetland to pond water)
- Change the ability of the wetland to receive floodflow from surrounding uplands
- Change the sinuosity of the watercourse within the wetland
- Change the density or type of vegetation within the wetland

Fish and Shellfish Habitat – does the direct impact to an aquatic resource, or work in uplands immediately adjacent to the wetland:

- Reduce the size of the wetland that is capable of supporting fish
- Change the connectivity of the wetland with the larger contiguous watercourse
- Reduce stream width to less than 50 feet
- Reduce water quality to a level that would not support fish
- Eliminate shading streamside vegetation

- Eliminate spawning areas (submerged vegetation or gravel beds)
- Introduce new barriers to fish (esp. anadromous /catadromous fish) movement
- Change water velocities so that they are excessive for fish
- Alter sediment load or change turbidity

Sediment/Toxicant/Pathogen Retention – does the direct impact to an aquatic resource, or work in uplands immediately adjacent to the wetland:

- Reduce the opportunity for sediment trapping by slowly moving water or deepwater habitats
- Reduce the duration of water retention in the wetland
- Result in the construction of drainage ditches within the wetland
- Increase water velocity within the wetland
- Reduce the degree of water and vegetation interspersion within the wetland
- Reduce the density or type of wetland vegetation that can trap or retain sediments
- Increase the input of sediment or toxicants to the wetland

Nutrient Removal/Retention/Transformation – does the direct impact to an aquatic resource, or work in uplands immediately adjacent to the wetland:

- Reduce the potential for sediment trapping
- Reduce the seasonal duration of wetland saturation/water ponding
- Reduce the density or type of wetland vegetation, especially emergent vegetation
- Decrease the retention time of water in the wetland
- Increase water velocity within the wetland
- Increase the discharge of nutrients to the wetland

Production Export – does the direct impact to an aquatic resource, or work in uplands immediately adjacent to the wetland:

- Reduce the wildlife food sources that grow within the wetland
- Reduce detritus development
- Reduce wildlife usage of the wetland
- Reduce fish usage of the wetland

- Reduce vegetation density
- Reduce the diversity of wetland plant species or the degree of plant community structure
- Alter the wetland outlet so that production export is reduced

Sediment/Shoreline Stabilization – does the direct impact to an aquatic resource, or work in uplands immediately adjacent to the wetland:

- Alter the existing bank and root mass
- Reduce the width of the wetland adjacent to the watercourse to less than 10 feet
- Increase flow velocity in the watercourse
- Reduce the density of wetland or aquatic vegetation on the bank
- Eliminate trees or woody shrubs on the bank that provide stabilization

Wildlife Habitat – does the direct impact to an aquatic resource, or work in uplands immediately adjacent to the wetland:

- Reduce water quality below Class A or B standards
- Fragment the wetland
- Create a barrier between other wetland systems
- Create a barrier to wildlife movement between the wetland and uplands
- Reduce the availability of wildlife food sources
- Reduce the degree of interspersion of vegetation classes/communities
- Change the dominant wetland class
- Reduce wetland vegetation density
- Reduce wetland plant diversity
- Reduce the abundance or diversity of insects
- Substantially reduce the IEI value as determined using CAPS
- Create extensive disturbance likely to introduce invasive plants
- Change hydrology of the wetland such that plant communities or habitats would be expected to change
- Introduce a new noise source with the potential to affect adjacent areas

- Create a canopy gap that could affect microclimate
- Fill a vernal pool
- Fill vernal pool habitat
- Result in the loss of vernal pool upland habitat

Recreation – does the direct impact to an aquatic resource, or work in uplands immediately adjacent to the wetland:

- Eliminate or reduce public access for fishing or hunting (where permitted)
- Eliminate or reduce access for hiking within the wetland
- Result in the discharge of pollutants to a waterbody or watercourse
- Adversely affect the visual/aesthetic quality of a recreational site
- Affect the ability of the wetland to function as a recreational site

Educational/Scientific Value – does the direct impact to an aquatic resource, or work in uplands immediately adjacent to the wetland:

- Introduce disturbance to an undisturbed educational site
- Affect access to an educational site
- Affect use for scientific or educational purposes (current use)
- Adversely affect the visual quality of an educational site

Uniqueness/Heritage – does the direct impact to an aquatic resource, or work in uplands immediately adjacent to the wetland:

- Affect the unique characteristics of the wetland (loss of a wetland class, loss of deep or shallow marsh), especially if a unique plant community is present
- Eliminate historic buildings or dams within the wetland
- Adversely affect an important archaeological site
- Adversely affect a wild and scenic river

Visual Quality/Aesthetics – does the direct impact to an aquatic resource, or work in uplands immediately adjacent to the wetland:

- Reduce the diversity of wetland classes visible from primary (public) viewing locations
- Eliminate wetland vegetation that provides fall color or masses of blooms
- Introduce signs of disturbance visible from primary viewing locations

- Introduce high noise level at primary viewing locations
- Obstruct sight lines through wetlands

Endangered Species Habitat – does the direct impact to an aquatic resource, or work in uplands immediately adjacent to the wetland:

- Adversely affects critical habitat for a state or federally listed T&E Species within the wetland
- Affect migration of T&E species within a wetland, or between wetland and upland habitats
- Reduce water quality
- Affect the supply of food resources for T&E species using the wetland

Checklist for Stormwater Report

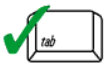
A. Introduction

Important: When filling out forms on the computer, use only the tab key to move your cursor - do not use the return key.



A Stormwater Report must be submitted with the Notice of Intent permit application to document compliance with the Stormwater Management Standards. The following checklist is NOT a substitute for the Stormwater Report (which should provide more substantive and detailed information) but is offered here as a tool to help the applicant organize their Stormwater Management documentation for their Report and for the reviewer to assess this information in a consistent format. As noted in the Checklist, the Stormwater Report must contain the engineering computations and supporting information set forth in Volume 3 of the Massachusetts Stormwater Handbook. The Stormwater Report must be prepared and certified by a Registered Professional Engineer (RPE) licensed in the Commonwealth.

The Stormwater Report must include:

- The Stormwater Checklist completed and stamped by a Registered Professional Engineer (see page 2) that certifies that the Stormwater Report contains all required submittals.[1] This Checklist is to be used as the cover for the completed Stormwater Report.
- Applicant/Project Name
- Project Address
- Name of Firm and Registered Professional Engineer that prepared the Report
- Long-Term Pollution Prevention Plan required by Standards 4-6
- Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan required by Standard 8[2]
- Operation and Maintenance Plan required by Standard 9

In addition to all plans and supporting information, the Stormwater Report must include a brief narrative describing stormwater management practices, including environmentally sensitive site design and LID techniques, along with a diagram depicting runoff through the proposed BMP treatment train. Plans are required to show existing and proposed conditions, identify all wetland resource areas, NRCS soil types, critical areas, Land Uses with Higher Potential Pollutant Loads (LUHPPL), and any areas on the site where infiltration rate is greater than 2.4 inches per hour. The Plans shall identify the drainage areas for both existing and proposed conditions at a scale that enables verification of supporting calculations.

As noted in the Checklist, the Stormwater Management Report shall document compliance with each of the Stormwater Management Standards as provided in the Massachusetts Stormwater Handbook. The soils evaluation and calculations shall be done using the methodologies set forth in Volume 3 of the Massachusetts Stormwater Handbook.

To ensure that the Stormwater Report is complete, applicants are required to fill in the Stormwater Report Checklist by checking the box to indicate that the specified information has been included in the Stormwater Report. If any of the information specified in the checklist has not been submitted, the applicant must provide an explanation. The completed Stormwater Report Checklist and Certification must be submitted with the Stormwater Report.

[1] The Stormwater Report may also include the Illicit Discharge Compliance Statement required by Standard 10. If not included in the Stormwater Report, the Illicit Discharge Compliance Statement must be submitted prior to the discharge of stormwater runoff to the post-construction best management practices.

[2] For some complex projects, it may not be possible to include the Construction Period Erosion and Sedimentation Control Plan in the Stormwater Report. In that event, the issuing authority has the discretion to issue an Order of Conditions that approves the project and includes a condition requiring the proponent to submit the Construction Period Erosion and Sedimentation Control Plan before commencing any land disturbance activity on the site.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

B. Stormwater Checklist and Certification

The following checklist is intended to serve as a guide for applicants as to the elements that ordinarily need to be addressed in a complete Stormwater Report. The checklist is also intended to provide conservation commissions and other reviewing authorities with a summary of the components necessary for a comprehensive Stormwater Report that addresses the ten Stormwater Standards.

Note: Because stormwater requirements vary from project to project, it is possible that a complete Stormwater Report may not include information on some of the subjects specified in the Checklist. If it is determined that a specific item does not apply to the project under review, please note that the item is not applicable (N.A.) and provide the reasons for that determination.

A complete checklist must include the Certification set forth below signed by the Registered Professional Engineer who prepared the Stormwater Report.

Registered Professional Engineer's Certification

I have reviewed the Stormwater Report, including the soil evaluation, computations, Long-term Pollution Prevention Plan, the Construction Period Erosion and Sedimentation Control Plan (if included), the Long-term Post-Construction Operation and Maintenance Plan, the Illicit Discharge Compliance Statement (if included) and the plans showing the stormwater management system, and have determined that they have been prepared in accordance with the requirements of the Stormwater Management Standards as further elaborated by the Massachusetts Stormwater Handbook. I have also determined that the information presented in the Stormwater Checklist is accurate and that the information presented in the Stormwater Report accurately reflects conditions at the site as of the date of this permit application.

Registered Professional Engineer Block and Signature

Signature and Date

Checklist

Project Type: Is the application for new development, redevelopment, or a mix of new and redevelopment?

☒ New development

☐ Redevelopment

☐ Mix of New Development and Redevelopment

Checklist for Stormwater Report

Checklist (continued)

LID Measures: Stormwater Standards require LID measures to be considered. Document what environmentally sensitive design and LID Techniques were considered during the planning and design of the project:

- ☐ No disturbance to any Wetland Resource Areas
- ☐ Site Design Practices (e.g. clustered development, reduced frontage setbacks)
- ☐ Reduced Impervious Area (Redevelopment Only)
- ☒ Minimizing disturbance to existing trees and shrubs
- ☐ LID Site Design Credit Requested:
  - ☐ Credit 1
  - ☐ Credit 2
  - ☐ Credit 3
- ☒ Use of "country drainage" versus curb and gutter conveyance and pipe
- ☐ Bioretention Cells (includes Rain Gardens)
- ☐ Constructed Stormwater Wetlands (includes Gravel Wetlands designs)
- ☐ Treebox Filter
- ☐ Water Quality Swale
- ☐ Grass Channel
- ☐ Green Roof
- ☒ Other (describe): Infiltration trenches

Standard 1: No New Untreated Discharges

- ☒ No new untreated discharges
- ☐ Outlets have been designed so there is no erosion or scour to wetlands and waters of the Commonwealth
- ☐ Supporting calculations specified in Volume 3 of the Massachusetts Stormwater Handbook included.

Checklist for Stormwater Report

Checklist (continued)

Standard 2: Peak Rate Attenuation

☐ Standard 2 waiver requested because the project is located in land subject to coastal storm flowage and stormwater discharge is to a wetland subject to coastal flooding.

☐ Evaluation provided to determine whether off-site flooding increases during the 100-year 24-hour storm.

☒ Calculations provided to show that post-development peak discharge rates do not exceed pre-development rates for the 2-year and 10-year 24-hour storms. If evaluation shows that off-site flooding increases during the 100-year 24-hour storm, calculations are also provided to show that post-development peak discharge rates do not exceed pre-development rates for the 100-year 24-hour storm.

Standard 3: Recharge

☐ Soil Analysis provided.

☒ Required Recharge Volume calculation provided.

☐ Required Recharge volume reduced through use of the LID site Design Credits.

☒ Sizing the infiltration, BMPs is based on the following method: Check the method used.

☒ Static ☐ Simple Dynamic ☐ Dynamic Field[1]

☒ Runoff from all impervious areas at the site discharging to the infiltration BMP.

☐ Runoff from all impervious areas at the site is *not* discharging to the infiltration BMP and calculations are provided showing that the drainage area contributing runoff to the infiltration BMPs is sufficient to generate the required recharge volume.

☒ Recharge BMPs have been sized to infiltrate the Required Recharge Volume.

☐ Recharge BMPs have been sized to infiltrate the Required Recharge Volume *only* to the maximum extent practicable for the following reason:

- ☐ Site is comprised solely of C and D soils and/or bedrock at the land surface
- ☐ M.G.L. c. 21E sites pursuant to 310 CMR 40.0000
- ☐ Solid Waste Landfill pursuant to 310 CMR 19.000
- ☐ Project is otherwise subject to Stormwater Management Standards only to the maximum extent practicable.

☒ Calculations showing that the infiltration BMPs will drain in 72 hours are provided.

☐ Property includes a M.G.L. c. 21E site or a solid waste landfill and a mounding analysis is included.

[1] 80% TSS removal is required prior to discharge to infiltration BMP if Dynamic Field method is used.

Checklist for Stormwater Report

Checklist (continued)

Standard 3: Recharge (continued)

☐ The infiltration BMP is used to attenuate peak flows during storms greater than or equal to the 10-year 24-hour storm and separation to seasonal high groundwater is less than 4 feet and a mounding analysis is provided.

☐ Documentation is provided showing that infiltration BMPs do not adversely impact nearby wetland resource areas.

Standard 4: Water Quality

The Long-Term Pollution Prevention Plan typically includes the following:

- Good housekeeping practices;
- Provisions for storing materials and waste products inside or under cover;
- Vehicle washing controls;
- Requirements for routine inspections and maintenance of stormwater BMPs;
- Spill prevention and response plans;
- Provisions for maintenance of lawns, gardens, and other landscaped areas;
- Requirements for storage and use of fertilizers, herbicides, and pesticides;
- Pet waste management provisions;
- Provisions for operation and management of septic systems;
- Provisions for solid waste management;
- Snow disposal and plowing plans relative to Wetland Resource Areas;
- Winter Road Salt and/or Sand Use and Storage restrictions;
- Street sweeping schedules;
- Provisions for prevention of illicit discharges to the stormwater management system;
- Documentation that Stormwater BMPs are designed to provide for shutdown and containment in the event of a spill or discharges to or near critical areas or from LUHPPL;
- Training for staff or personnel involved with implementing Long-Term Pollution Prevention Plan;
- List of Emergency contacts for implementing Long-Term Pollution Prevention Plan.

☐ A Long-Term Pollution Prevention Plan is attached to Stormwater Report and is included as an attachment to the Wetlands Notice of Intent.

☒ Treatment BMPs subject to the 44% TSS removal pretreatment requirement and the one inch rule for calculating the water quality volume are included, and discharge:

- ☐ is within the Zone II or Interim Wellhead Protection Area
- ☒ is near or to other critical areas
- ☐ is within soils with a rapid infiltration rate (greater than 2.4 inches per hour)
- ☐ involves runoff from land uses with higher potential pollutant loads.

☐ The Required Water Quality Volume is reduced through use of the LID site Design Credits.

☒ Calculations documenting that the treatment train meets the 80% TSS removal requirement and, if applicable, the 44% TSS removal pretreatment requirement, are provided.

Checklist for Stormwater Report

Checklist (continued)

Standard 4: Water Quality (continued)

☒ The BMP is sized (and calculations provided) based on:

- ☒ The ½" or 1" Water Quality Volume or
- ☐ The equivalent flow rate associated with the Water Quality Volume and documentation is provided showing that the BMP treats the required water quality volume.

☐ The applicant proposes to use proprietary BMPs, and documentation supporting use of proprietary BMP and proposed TSS removal rate is provided. This documentation may be in the form of the propriety BMP checklist found in Volume 2, Chapter 4 of the Massachusetts Stormwater Handbook and submitting copies of the TARP Report, STEP Report, and/or other third party studies verifying performance of the proprietary BMPs.

☐ A TMDL exists that indicates a need to reduce pollutants other than TSS and documentation showing that the BMPs selected are consistent with the TMDL is provided.

Standard 5: Land Uses With Higher Potential Pollutant Loads (LUHPPLs)

☐ The NPDES Multi-Sector General Permit covers the land use and the Stormwater Pollution Prevention Plan (SWPPP) has been included with the Stormwater Report.

☒ The NPDES Multi-Sector General Permit covers the land use and the SWPPP will be submitted ***prior to*** the discharge of stormwater to the post-construction stormwater BMPs.

☐ The NPDES Multi-Sector General Permit does ***not*** cover the land use.

☐ LUHPPLs are located at the site and industry specific source control and pollution prevention measures have been proposed to reduce or eliminate the exposure of LUHPPLs to rain, snow, snow melt and runoff, and been included in the long term Pollution Prevention Plan.

☐ All exposure has been eliminated.

☐ All exposure has ***not*** been eliminated and all BMPs selected are on MassDEP LUHPPL list.

☐ The LUHPPL has the potential to generate runoff with moderate to higher concentrations of oil and grease (e.g. all parking lots with >1000 vehicle trips per day) and the treatment train includes an oil grit separator, a filtering bioretention area, a sand filter or equivalent.

Standard 6: Critical Areas

☒ The discharge is near or to a critical area and the treatment train includes only BMPs that MassDEP has approved for stormwater discharges to or near that particular class of critical area.

☒ Critical areas and BMPs are identified in the Stormwater Report.

Checklist for Stormwater Report

Checklist (continued)

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the maximum extent practicable

☐ The project is subject to the Stormwater Management Standards only to the maximum Extent Practicable as a:

- ☐ Limited Project
- ☐ Small Residential Projects: 5-9 single family houses or 5-9 units in a multi-family development provided there is no discharge that may potentially affect a critical area.
- ☐ Small Residential Projects: 2-4 single family houses or 2-4 units in a multi-family development with a discharge to a critical area
- ☐ Marina and/or boatyard provided the hull painting, service and maintenance areas are protected from exposure to rain, snow, snow melt and runoff
- ☐ Bike Path and/or Foot Path
- ☐ Redevelopment Project
- ☐ Redevelopment portion of mix of new and redevelopment.

☐ Certain standards are not fully met (Standard No. 1, 8, 9, and 10 must always be fully met) and an explanation of why these standards are not met is contained in the Stormwater Report.

☐ The project involves redevelopment and a description of all measures that have been taken to improve existing conditions is provided in the Stormwater Report. The redevelopment checklist found in Volume 2 Chapter 3 of the Massachusetts Stormwater Handbook may be used to document that the proposed stormwater management system (a) complies with Standards 2, 3 and the pretreatment and structural BMP requirements of Standards 4-6 to the maximum extent practicable and (b) improves existing conditions.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control

A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan must include the following information:

- Narrative;
- Construction Period Operation and Maintenance Plan;
- Names of Persons or Entity Responsible for Plan Compliance;
- Construction Period Pollution Prevention Measures;
- Erosion and Sedimentation Control Plan Drawings;
- Detail drawings and specifications for erosion control BMPs, including sizing calculations;
- Vegetation Planning;
- Site Development Plan;
- Construction Sequencing Plan;
- Sequencing of Erosion and Sedimentation Controls;
- Operation and Maintenance of Erosion and Sedimentation Controls;
- Inspection Schedule;
- Maintenance Schedule;
- Inspection and Maintenance Log Form.

☐ A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan containing the information set forth above has been included in the Stormwater Report.

Checklist for Stormwater Report

Checklist (continued)

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control (continued)

☐ The project is highly complex and information is included in the Stormwater Report that explains why it is not possible to submit the Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan with the application. A Construction Period Pollution Prevention and Erosion and Sedimentation Control has ***not*** been included in the Stormwater Report but will be submitted ***before*** land disturbance begins.

☐ The project is ***not*** covered by a NPDES Construction General Permit.

☐ The project is covered by a NPDES Construction General Permit and a copy of the SWPPP is in the Stormwater Report.

☒ The project is covered by a NPDES Construction General Permit but no SWPPP been submitted. The SWPPP will be submitted BEFORE land disturbance begins.

Standard 9: Operation and Maintenance Plan

☒ The Post Construction Operation and Maintenance Plan is included in the Stormwater Report and includes the following information:

- ☐ Name of the stormwater management system owners;
- ☐ Party responsible for operation and maintenance;
- ☐ Schedule for implementation of routine and non-routine maintenance tasks;
- ☐ Plan showing the location of all stormwater BMPs maintenance access areas;
- ☐ Description and delineation of public safety features;
- ☐ Estimated operation and maintenance budget; and
- ☐ Operation and Maintenance Log Form.

☐ The responsible party is ***not*** the owner of the parcel where the BMP is located and the Stormwater Report includes the following submissions:

- ☐ A copy of the legal instrument (deed, homeowner's association, utility trust or other legal entity) that establishes the terms of and legal responsibility for the operation and maintenance of the project site stormwater BMPs;
- ☐ A plan and easement deed that allows site access for the legal entity to operate and maintain BMP functions.

Standard 10: Prohibition of Illicit Discharges

☒ The Long-Term Pollution Prevention Plan includes measures to prevent illicit discharges;

☐ An Illicit Discharge Compliance Statement is attached;

☐ NO Illicit Discharge Compliance Statement is attached but will be submitted ***prior to*** the discharge of any stormwater to post-construction BMPs.

Stormwater Report Narrative

This Stormwater Report has been prepared to demonstrate compliance with the Massachusetts Stormwater Management Standards in accordance with the Massachusetts Wetlands Protection Act Regulations (310 CMR 10.00) and Water Quality Certification Regulations (314 CMR 9.00).

Project Description

MassDOT is proposing to construct an 8,500-foot long railroad trestle along the out-of-service portion of the Stoughton Line between Foundry Street in Easton, Massachusetts and the Raynham Park grade crossing in Raynham, Massachusetts (the Project). The trestle would be constructed in order to restore commuter rail service through this corridor while avoiding and minimizing wetland impacts in the Hockomock Swamp. The Project will involve driving piles at 50-foot intervals along the Project corridor, installing pile caps, decking, and ballasted trestle superstructure elements on top of the piles, and constructing retaining walls and embankments on either end of the trestle to return the track to grade. In order to provide stormwater management for runoff from the trestle, infiltration trenches will be constructed beneath the proposed trestle.

The project is not considered a Land Use with Higher Potential Pollutant Loads (LUHPPL) as defined in 310 CMR 10.04 and 314 CMR 9.02.

Site Description

The Project site is part of an existing railroad right-of-way located between Foundry Street in Easton and the Raynham Park grade crossing in Raynham (Figures 1 and 2). Tracks and ties were removed from this segment in the 1960s and the embankment which remains through the corridor is utilized by pedestrians and all-terrain vehicles (ATVs).

The corridor is within the Hockomock Swamp Area of Critical Environmental Concern (ACEC) and is surrounded by wetland resources along most of its length. For additional information regarding the wetland resource areas present on the site see the Abbreviated Notices of Resource Area Delineation (ANRADs) for Easton and Raynham prepared by VHB dated May 2011.

The Project site consists of an earthen embankment (fill material and old railroad ballast) that rises approximately 2 to 3 feet above the adjacent wetlands. The embankment is topped by a gravel/dirt track kept relatively free from vegetation by off-road vehicles. According to the National Resources Conservation Service (NRCS), the dominant surface soil below the embankment (covering 80 percent of the area) is

Freetown muck, a soil classified as Hydrologic Soil Group (HSG) D. However, the geotechnical study of the Project corridor determined that the predominant soils within the embankment were loamy fine sands, which may be capable of higher infiltration rates. Based on the soil evaluation, the Project site is not considered to be within an area of rapid infiltration (soils with a saturated hydraulic conductivity greater than 2.4 inches per hour). The poorly drained soils onsite have a low potential for infiltration; According to 1982 Rawls Rates for sandy clay loam, infiltration rates for the soils will be approximately 0.17 inches per hour.

The Project corridor is located within the 100-year flood plain as shown on the FEMA Floodway Maps, Town of Easton, Massachusetts Bristol County, Community Panel Numbers 25005C00064F and 25005C0152F dated July 7, 2009. These maps are included in Appendix B.

Existing Drainage Conditions

The Project site consists of an earthen embankment that rises approximately 2 to 3 feet above the adjacent wetlands. The embankment is topped by a gravel/dirt track kept relatively free from vegetation by off-road vehicles. The sides and some sections of the top of the embankment are covered by brush and saplings. Although slight variations in cover type and soils may occur along the length of the trestle corridor, the contributing watersheds are nearly identical in terms of slope and area. Evaluating a typical or "unit" drainage area for the existing conditions analysis allows for direct comparison to be made between existing and proposed conditions. This unit drainage area would then be replicated along the length of the trestle corridor. For the existing conditions hydrologic analysis, the site was evaluated as a single design point representing runoff from a 300-foot segment of the embankment, or approximately 0.14 acres (6,000 square feet). This segment length was selected because it corresponds to a whole number of proposed spans. In addition, because the existing berm is narrow and level, the use of smaller drainage areas more closely models existing conditions.

Existing Unit Drainage Area – The existing unit drainage area of 0.14 acres was conservatively assumed to be covered with brush in fair condition, discounting the contribution from the gravel/dirt track. Under existing conditions, runoff from this area sheet flows, untreated, to the wetlands on either side of the embankment.

Figure 3 illustrates the existing drainage patterns within a typical unit drainage area. Table 1 provides a summary of the existing conditions hydrologic data.

Table 1
Existing Conditions Hydrologic Data

Drainage Area	*Discharge Location*	*Design Point*	*Area (acres)*	*Curve Number*	*Time of Concentration (min)*
EX	Adjacent Wetland	1	0.14	70	6

Proposed Drainage Conditions

The proposed trestle would be constructed on piles and would elevate the track above the existing embankment to avoid wetland impacts. Specifically, the use of a structure significantly reduces the amount of earthwork required to meet the design requirements for a safe high-speed train track while providing proper track support and ballast drainage. The structure will be designed with a minimum of 5 feet of vertical clearance to allow unimpeded movement of wildlife across the embankment. This open space beneath the structure will provide opportunities for the construction of decentralized stormwater management features that can treat runoff from the structure without impacting adjacent wetland resource areas.

Drainage for the trestle is proposed to be handled by evaluating a unit drainage area and repeating that drainage design along the length of the trestle. Minor local modifications to this treatment design may be required during final design. The following is a summary of the proposed unit drainage area and treatment design.

Proposed Unit Drainage Area – Under proposed conditions, drainage will be addressed by a unit design that treats stormwater from the 20-foot wide trestle in 300-foot segments (i.e., six 50-foot spans of trestle deck). The area of this unit design corresponds to the 6,000 square foot area previously evaluated under existing conditions. The unit design will consist of an underdrain collection system within the ballast of the trestle deck leading to downspouts. The downspouts will convey stormwater from the trestle deck and direct it to gravel-lined infiltration trenches beneath the deck. There will be one infiltration trench for each 300 feet of trestle, requiring a total of approximately 30 infiltration trenches along the length of the trestle. Each proposed infiltration trench will each be 16 feet wide by 33 feet long and will be 1 foot deep. The length of the trenches is constrained by the spacing of the pile bents and the 5-foot setback that is required from each pile bent.

Figure 4 illustrates the proposed "post construction" drainage conditions for the project. Table 2 provides a summary of the proposed conditions hydrologic data.

Table 2
Proposed Conditions Hydrologic Data

Drainage Area	*Discharge Location*	*Design Point*	*Area (acres)*	*Curve Number*	*Time of Concentration (min)*
PR	Adjacent Wetland	1	0.14	98	6

As shown on the typical plans and sections (see Figure 5, 6, and 7), the trestle will consist of a bed of ballast that supports the tracks and ties, with a concrete walkway on one side and a concrete apron on the other. The ballast is off set from the center line of the trestle in order to provide a safe zone along the walkway if workers are present when a train crosses the trestle. The narrower apron on the opposite side of the ballast is an integral part of the structural support for the ballast deck and provides support for a railing.

The surface of the trestle is assumed to be completely impervious because it will be a solid concrete structure. Any rainfall that lands on the ballast or on the exposed portions of the deck will drain through the ballast and be collected by an underdrain prior to discharge. The underdrain will run the length of the trestle and will be connected to downspouts located at intervals along the length of the trestle. These downspouts will be piped to the infiltration trenches that will be located beneath the trestle between sets of pile bents.

The ballast which supports the track within the trestle will capture coarse particulates and drippings from the trains by adsorption onto the stone and minimizes the potential to contaminate stormwater. This ballast will be periodically replaced as part of regular operations and maintenance, and any accumulated materials will be removed at that time. Because train operations do not generate suspended solids and the trestle will not be sanded during winter operations, the trestle will effectively function as a roof and runoff from the trestle is not anticipated to contain suspended solids. Any solids present due to atmospheric deposition will be managed by the infiltration trenches.

The Project site has been designed with a comprehensive stormwater management system that has been developed in accordance with the Massachusetts Stormwater Handbook.

Environmentally Sensitive and Low Impact Development (LID) Techniques

Low Impact Development (LID) techniques and stormwater Best Management Practices (BMPs) implemented into the site design include:

- Minimal disturbance to exiting trees and vegetation;
- Infiltration practices; and
- Decentralized treatment and discharge locations.

Stormwater runoff from all impervious surfaces in proposed conditions will receive treatment for stormwater quality prior to discharge to the existing design points. Under existing conditions no such treatment is provided for stormwater runoff.

By using a series of small, decentralized stormwater management features, existing drainage patterns will be maintained to the maximum extent practicable. Low impact development stormwater management techniques have been incorporated into the design, including minimizing disturbance within environmentally sensitive areas and promoting infiltration. These practices will reduce peak runoff rates, maximize groundwater recharge and treat for water quality. In addition, wetland impacts are avoided that might occur if a centralized stormwater management facility was required.

Regulatory Compliance

Massachusetts Department of Environmental Protection (DEP) - Stormwater Management Standards

As demonstrated below, the Project fully complies with the MassDEP Stormwater Management Standards at 310 CMR 10.05.

Standard 1: No New Untreated Discharges or Erosion to Wetlands

The Project has been designed to fully comply with Standard 1.

The BMPs included in the proposed stormwater management system have been designed in accordance with the Massachusetts Stormwater Handbook. Supporting information and computations demonstrating that no new untreated discharges would result from the Project are presented through compliance with Standards 4 through 6.

The proposed outlets from the stormwater management system have been designed to not cause erosion or scour to wetlands or receiving waters. Because of the storage volume within the ballast and infiltration trenches, discharge rates from the trestle will be less than 1 cubic foot per second (cfs) up to the 100-year storm event. Overflow outlets have been designed with stone protection to dissipate flows that may be discharged during large storm events.

Computations and supporting information for the sizing and selection of materials used to protect from scour and erosion are included in Appendix A.

Standard 2: Peak Rate Attenuation

The Project has been designed to fully comply with Standard 2.

The rainfall-runoff response of the Project site under existing and proposed conditions was analyzed for storm events with recurrence intervals of 2, 10, and 100-years. The results of the analysis, as summarized in Table 3 below, indicate that there is no increase in peak discharge rates between the existing and proposed conditions.

Computations and supporting information regarding the hydrologic modeling are included in Appendix B.

Table 3
Unit Drainage Area Peak Discharge Rates (cfs*)

Design Point	*2-year*	*10-year*	*100-year*
Design Point 1: Adjacent Wetland			
Existing	0.12	0.28	0.56
Proposed	0.05	0.14	0.26

*cubic foot per second

Standard 3: Stormwater Recharge

The Project has been designed to fully comply with Standard 3.

In accordance with the Stormwater Handbook, the Required Recharge Volume for each Unit Drainage Area of the Project is 127 cubic feet. Recharge of stormwater has been provided through the use of infiltration basins which have been sized using the static method. Each infiltration trench will provide 254 cubic feet of recharge and has been designed to drain completely within 72 hours.

A Geotechnical Report that describes subsurface soil conditions is included in Appendix E.

Standard 4: Water Quality

The Project has been designed to fully comply with Standard 4.

Standard 4 specifies that "Stormwater Management Systems shall be designed to remove 80% of the average annual post-construction load of Total Suspended Solids (TSS)." As previously noted, rail operations generate negligible quantities of TSS. Because the trestle consists of ballast placed inside a solid structure, stormwater runoff must be managed differently than that from ballast placed directly on the ground; however the TSS loading would be similarly negligible.

Each infiltration trench has been designed to meet the 0.5-inch Water Quality Volume for its contributing drainage area. Because of the trestle's configuration and setting, it is not feasible to provide the full 1-inch Water Quality Volume and the 44 percent pretreatment required to receive credit for 80 percent TSS removal under the guidelines contained in the Stormwater Handbook. However, discharges from the trestle can be considered *de minimus* under the guidance provided in Volume 3, Chapter 1 of the Handbook. The Handbook specifies the following criteria for a *de minimus* determination:

- Physical sit conditions preclude installation of a TSS treatment practice.
- The discharge is less than or equal to 1 cfs for runoff associated with the 2-year 24-hour storm.
- 80 percent TSS removal is achieved on an average weighted basis from the site as a whole using the weighted average method.

- The stormwater outlets where additional controls are used to achieve more than 80 percent TSS removal must discharge to the same reach of the same wetland or waterbody as the outlets that achieve less than 80 percent TSS removal.
- Controls are placed at the outlet to prevent erosion or scour of the wetland/stream channel and bank.
- Standard 2 and Standard 3 must be achieved on a site-wide basis.
- Source control and pollution prevention measures that mitigate the impact of the untreated or partially treated discharges are identified in the Pollution Prevention Plan.
- The size of the drainage area contributing runoff to the untreated outlet has been reduced to the maximum extent practicable.

Standard 5: Land Uses with Higher Potential Pollutant Loads (LUHPPLs)

The site is not considered a Land Use with Higher Potential Pollutant Loads (LUHPPL) as defined in 310 CMR 10.04 and 314 CMR 9.02.

Standard 6: Critical Areas

The Project would discharge treated storm water to a critical area, the Hockomock Swamp Area of Critical Environmental Concern, via overland flow during large storm events. As described above under Standard 4, physical site conditions preclude installation of treatment practices of sufficient size to meet the 1-inch Water Quality Volume and perform 44 percent TSS removal prior to infiltration. However, the trestle meets the requirements of a *de minimus* determination and is not anticipated to negatively impact water quality within the Hockomock Swamp. Proposed source controls and pollution prevention measures will be identified in the Long-Term Pollution Prevention Plan that will be required as part of final design.

For computations and supporting information regarding the sizing of BMPs suitable for treatment of runoff near or to critical areas, see Appendix D.

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the Maximum Extent Practicable

The Project is not a redevelopment.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Controls

The Project is required to obtain coverage under the Environmental Protection Agency (EPA) National Pollutant Discharge Elimination System (NPDES) Construction General Permit (CGP). As required under this permit, a Stormwater Pollution Prevention Plan (SWPPP) would be developed and a Notice of Intent for

the CGP would be submitted by the contractor and owner at least 14 days before land disturbance begins. Recommended construction period pollution prevention and erosion and sedimentation controls were discussed in the DEIS/DEIR. Appropriate controls will be prepared and implemented by the contractor and MassDOT (MBTA) during construction in accordance with the final design and NPDES SWPPP.

Standard 9: Operation and Maintenance Plan

In compliance with Standard 9, a Post Construction Stormwater Operation and Maintenance (O&M) Plan will be developed by the MassDOT during final design for the Project.

Standard 10: Prohibition of Illicit Discharges

No sanitary sewer lines are known to exist in this area and no subsurface storm drainage structures or pipes are proposed to be constructed in this project area. The Long-Term Pollution Prevention Plan will include measures to prevent illicit discharges.

Appendix B
Standard 2 Computations and Supporting Information

Rainfall volumes used for this analysis were based on the Natural Resources Conservation Service (NRCS) Type III, 24-hour storm event for Bristol County. Runoff coefficients for the existing and proposed conditions, as previously shown in Tables 1 and 2 respectively, were determined using NRCS Technical Release 55 (TR-55) methodology as provided in HydroCAD. The HydroCAD model is based on the NRCS Technical Release 20 (TR-20) Model for Project Formulation Hydrology.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Geotechnical Report

JACOBS™
343 Congress Street
Boston, MA 02210

Design Memorandum

Date	March 28, 2012
To	Rick Carey, Natasha Velickovic - VHB
From	Paul Murphy, Peter Chou, Ahmad Hasan - Jacobs
Subject	MBTA South Coast Rail (New Bedford/Fall River Commuter Rail Extension) Hockomock Swamp Preliminary Geotechnical Recommendations Easton and Raynham, MA
Project No.	E2347101

INTRODUCTION

The South Coast Rail project will restore passenger rail transportation from South Station in Boston to the cities of Fall River and New Bedford. The project limits are between South Station in Boston and the termini in Falls River and New Bedford, Massachusetts. The MBTA's selected route, the Stoughton Alternative will traverse through the towns of Stoughton, Easton, Raynham, and Taunton, and will continue along an existing rail freight corridor running south from Taunton to Fall River and New Bedford. The project will include the reconstruction of several existing stations and construction of new passenger stations and two terminal layover facilities. This memorandum presents the preliminary geotechnical assessment report of the Hockomock Swamp Area located in the towns of Easton and Raynham, Massachusetts. The preliminary design recommendations presented in this report are based on the results of subsurface exploration performed by Jacobs in 2012.

Existing Conditions

The proposed railway alignment at the Hockomock Swamp area is shown in Figure 1. The site has several wetland areas, and vegetated open fields. The site extends from the south of Purchase Street at Station 1325+50 and continues south to Station 1531+00 at Raynham Park Crossing. Compared to existing grades adjacent to the existing embankment, it appears that 3 to 5 feet of fill may have been placed to create the embankment for the former railroad in this area through the Hockomock Swamp. Existing grades along the proposed tracks range from approximately elevation 69.5 to 123.5 feet (NGVD29 Datum).

Proposed Construction

Current plans are to install a single track on the alignment. An 8,500-foot long trestle will be constructed within the swamp between Stations 1425+00 and 1510+00. A maintenance turnout will be provided from Station 1462+00 to approximately 1468+00. The details of new track layout (including grading) and the trestle span arrangements are still under development at the time of this preliminary report preparation. Span lengths of 30, 40, and 50 feet are being considered for the trestle. The trestle will be 20 feet wide. A 4 feet wide catenary overhang on either side will be installed at every 200 feet on an extended pier cap. This report focuses on the Preliminary Geotechnical Study at the Hockomock Swamp area, and includes design and recommendation for at-grade railroad tracks and the trestle.

SCOPE OF WORK

This memorandum is prepared by Jacobs in accordance with the scope of work under the contract between Jacobs and VHB for work on the New Bedford/Fall River Commuter Rail Line Extension Project for Massachusetts Bay Transportation Authority (MBTA). The geotechnical work included the following tasks:

- Perform geotechnical explorations with twenty widely spaced borings and conduct a laboratory testing program;
- Report and interpret the results of the explorations and laboratory testing program; and
- Provide preliminary geotechnical recommendations for design and construction of the trestle foundations and at-grade tracks.

The Jacobs scope of work did not include environmental assessment of the potential presence of any hazardous materials at the project site or potential impacts to adjacent structures during construction.

LOCAL GEOLOGY

The geologic map of Massachusetts shows the Hockomock Swamp to be located in the Narragansett Basin, underlain and surrounded to the north and south by the Milford-Dedham zone. The bedrock in the Narragansett Basin is lightly metamorphosed siltstone, shale, greywacke, argillite, and coarse-grained conglomerate of Pennsylvanian and Permian age. The bedrock in the Milford-Dedham zone is mostly granite of Proterozoic age.

Hockomock Swamp is a vast wetland, encompassing as much as 6,000 acres of southeastern Massachusetts in Bristol and Plymouth Counties. It is the largest peatland in Massachusetts. Approximately 12,000 years ago, the area was part of the Glacial Lake Taunton, occupying a location between the glacial ice to the north and higher land to the south. Fine textured sediments consisting of varved silts and clays as much as 100 feet thick were deposited within this lake. As the ice retreated, the land rebounded or uplifted, and the lake began to fill in with alluvial deposits washed into low spots by streams cutting through glacial deposits of gravel, clay and sand. Loose, non-compacted peat deposits formed at the bottom of the lake and may extend to depths of 20 to 60 feet below ground surface at certain locations within the swamp. The area generally is characterized by shallow and deep organic soils and alluvial soils underlain by thick deposits of silts and clays. The old glacial lake bed gradually became the soggy swampy woodland of the Hockomock Swamp.

Soils associated with the Glacial Lake Taunton and Hockomock Swamp include the Scio, Raynham, Birdsall, and Enosburg Series. These soils consist of nearly level to gently sloping, moderately well-drained to predominantly poorly-drained soils which were formed on old lake beds.

GEOTECHNICAL EXPLORATIONS

A subsurface exploration program consisting of 20 borings were drilled for this project in February, 2012. Jacobs planned the subsurface exploration program and retained the drilling contractor to perform the explorations. A total of eleven at-grade alignment borings (HS-1 through HS-11) and nine trestle borings (HST-1 through HST-9) were drilled for the proposed crossing through Hockomock Swamp. Boring locations are shown on the Subsurface Exploration Plan (Figures 2A – 2I). The at-grade alignment borings were drilled to depths ranging from 25 to 50 feet below ground surface, while the trestle borings were typically drilled to depths of 55 to 75 feet below grade. One trestle boring (HST-9) was roller-bit drilled through weathered rock to a depth of 120 feet.

The test borings were drilled by New Hampshire Boring under subcontract to Jacobs using several different drill rigs including a remote-controlled ATV mounted drill rig, a D-50 ATV mounted drill rig, and a Mobile drill rig. The borings were advanced through the soil primarily using wash boring with casing drill methods, although some of the borings used augers in the first 5 feet of boring. Three of the at-grade borings and six of the trestle borings were advanced into the underlying bedrock using NX rock coring methods. Standard penetration tests (SPT), consisting of a 140-pound safety hammer dropping 30 inches onto a standard 2-inch-diameter (OD) split-spoon sampler, were performed to establish the consistency of the subsurface soils. The SPT's were typically performed at 5 foot intervals for full length of boring. The obtained samples were sealed in glass jars to retain their natural moisture. In four of the borings (HS-1, HS-6, HST-3, and HST-8), observation wells with 10-foot long screens set at a depth of 5 to 15 feet below ground surface were installed to monitor fluctuations in the groundwater level.

The borings were observed by a representative from Jacobs. The soil samples were classified in the field in accordance with ASTM D2488, Standard Practice for Description and Identification of Soils (Visual-Manual Procedure) by Jacobs' representative, and appropriate stratum breaks were interpolated from drilling and sampling observations. Top of boring elevations were obtained from the project cross section developed by VHB. The boring logs were prepared by Jacobs based on the field classifications and laboratory testing, and are presented in Appendix A.

LABORATORY TESTING

Laboratory tests were performed to determine the physical and engineering characteristics of selected split-spoon and undisturbed soil samples obtained during the subsurface exploration program. The Laboratory testing was conducted by GeoTesting Express under subcontract to Jacobs. The testing program was in general accordance with ASTM standards, and included moisture content determination, grain size analysis, Atterberg Limits, triaxial unconfined undrained test, density determination, consolidation, soil pH, soil organic content, and soil electrical resistivity. Unconfined compression tests were performed on representative samples of the bedrock recovered from the core borings. The results for rock and soils testing are summarized in Tables 1 and 2.

Table 1: Summary of Laboratory Test Results for Bedrock

SUBSURFACE CONDITIONS

The subsurface conditions at the site were inferred from the boring data collected for this project, with some interpretations. The subsurface conditions encountered in the borings drilled for this project generally consist of a layer of granular fill with thickness of about 0 to 3 feet, underlain by natural, loose to dense stratified silt and sand deposits, and very dense glacial till. A thin 2- to 7-foot thick layer of organic silt was encountered in the upper 5 to 10 feet of soil in almost all of the trestle borings. Boulders were encountered in several of the borings. The till was often underlain by severely to completely weathered rock (generally appearing as silt with gravel) which could be penetrated by roller-bit drilling but often resulted in SPT N-counts ranging from 100 blows for 1- to 9-inch penetration to 100 blows per 1 inch penetration. Bedrock along the alignment was noted to include weathered shale, siltstone and granite.

Subsurface soil conditions are summarized in Table 3 below.

Table 3: Summary of Subsurface Conditions at Borings

NE = Not encountered at the boring during drilling; NM = Not measured.

Fill: Compared to existing grades adjacent to the existing embankment, it appears that 3 to 5 feet of fill may have been placed to create the embankment for the former railroad in this area through the Hockomock Swamp. The uppermost soils encountered in the borings typically consisted of well-graded sand containing secondary amounts of silt and fine gravel.

Organic Soil: A one to five foot thick layer of organic silt/peat was encountered within the upper 5 to 10 feet of soil in several of the trestle borings (HST-1, -2, -3, -4, -5, -6, and -7). These borings are located adjacent to wetland areas. The elevation of the bottom of the organic layer generally decreased to the south, ranging from ± El. 74 ft at Boring HST-1 to ± El. 61.5 ft in Boring HST-7. Organic soils may also be located near other wetland areas at the site.

Natural Granular Deposits: The natural soil deposits below the fill materials or organic soils is quite variable but generally consist of predominantly poorly (SP) to well graded (SW) sand containing secondary amounts of silt and/or gravel, silty sand (SM), and interlayers of fine-grained silt (ML), low plasticity clay (CL, ML-CL), or occasionally high plasticity clay (CH). The sand and gravel deposits are loose to very dense with Standard Penetration Test (SPT) N-values ranging between 6 and 100 blows per foot (bpf) and averaging about 29 bpf. The fine-grained interlayers ranged from medium stiff to hard, with SPT N-values ranging generally from 8 bpf to 44 bpf.

Glacial Till: Dense to very dense glacial till consisting predominantly of well graded sand (SW) with little to some (15 to 45 percent) gravel and silt and ranging from 2 to 25 feet thick was encountered in several of the at-grade alignment borings. The glacial till encountered in the at-grade alignment borings appeared to dip to

the south, being encountered in Boring HS-2 at 9 to 19 feet depth (± El. 106 to El. 96 ft), in Boring HS-6 at 20 to 35 feet depth (± El. 57.7 to El. 42.7 ft), in Boring HS-7 at 35 to 42 ft depth (El. 43.1 to El. 36.1 ft) and in Boring HS-9 at 39 to 41 ft depth (El. 40.2 to El. 38.2 ft).

The glacial till was also encountered in all of the trestle borings, ranging from about 3 to 20 feet thick and generally encountered at depths between 35 and 65 feet below ground surface. SPT N-counts ranged from 27 blows per foot to 100 blows per 1 inch penetration. The glacial till was typically underlain by weathered rock or harder rock which could be cored. In a few cases, the bottom of the till layer was underlain by a layer of boulders.

Bedrock: Bedrock recovered in the test borings was typically severely to completely weathered and difficult to classify. The completely weathered rock was often recovered as silt with gravel (ML). In several areas, roller-bit drilling was able to penetrate as much as nearly 45 feet into weathered rock without having to switch over to rock coring methods. Associated SPT N-values in the completely weathered rock ranged from 100 blows per 1 to 9 inch penetration. Where slightly harder rock was encountered, NX coring was used to penetrate as much as 10 feet into the rock. Core recoveries and Rock Quality Designation (RQD) values of the samples recovered via NX coring ranged from 14 to 60 percent and from 0 to 60 percent, respectively, indicative of primarily very poor to poor quality rock. The top of rock was typically encountered at depths ranging from 9 to 35 feet depth in the at-grade alignment borings and 39 to 66.5 feet depth along the trestle borings as presented in Table 2.

Groundwater: Groundwater levels were measured in the test borings using a weighted tape during and at completion of drilling. The data indicated the groundwater level to be approximately 2 to 11 feet below ground surface, ranging from approximate elevations 68 to 121.5 feet along the at-grade borings and from elevations 64 to 70 feet in the trestle area. Groundwater level readings at termination of drilling were consistently at 3.5 to 6 feet depth along the trestle borings. The use of wash boring techniques for some of the borings may have artificially increased the water level readings due to the addition of water to the borings; however, it is anticipated that the groundwater is very shallow throughout the wetland areas encompassed by this project.

Groundwater levels should be expected to fluctuate with rainfall and other seasonal variations. More long-term observations would be required to evaluate true groundwater levels and their influence on planned construction.

GEOTECHNICAL RECOMMENDATIONS

Based on the contour maps shown on the boring location plan, the immediate alignment appears to be built up about 3 to 5 feet above the surrounding wetland areas. The built up width appears to be the corridor previously used for railroad traffic and is currently abandoned. The railroad tracks at Hockomock Swamp will be installed on at-grade sections, and on an 8,500-foot long trestle through the swamp.

Trestle Loading

For the preliminary design, span lengths of 30, 40, and 50 feet are being considered for the trestle. Trestle pier loading, as determined by VHB is shown in the table below:

Table 4 – Trestle Bent Loads

Pier Span	Dead Load, D*	Live Load, L	Impact Load, I	Longitudinal Braking**			Longitudinal Traction**		
				Force, LF_B	Moment, M_B***	Vertical, V_B	Force, LF_T	Moment, M_T***	Vert., V_T
(ft)	(kips)	(kips)	(kips)	(kips)	(k-ft)	(kips)	(kips)	(k-ft)	(kips)
30	330	346	142	81	1,235	41	137	1,404	47
40	425	432	153	93	1,418	35	158	1,620	40
50	520	546	174	105	1,601	32	177	1,814	36

Notes:

* Dead load includes weight of pier cap (50 kips for a single row of piles and 100 kips for a double row)

** Longitudinal braking and tractive forces are applied as a longitudinal lateral force (LF) at center height of the pier cap.

***The moments are about the center of the pier cap. The moment is applied to the piers as a vertical couple applied downward on the pier at one end of the span and upward on the pier at the other end of the span. The moment is not applied directly to the pier cap, but is only given for information.

Trestle Foundations

Various foundation alternatives were investigated to support the trestle foundations. Preliminary foundation type selection took into account soil conditions and shear strength of near surface soils, and depth to bedrock.

Spread Footings: Spread footings were evaluated for pier support. Given the strength consistency of the upper overburden soils to be mostly loose to medium dense, and the presence of organic soils, the spread footing option was discarded.

Drilled Shafts: Drilled shafts were considered but due to the high ground water level and the variable depth to bedrock within the trestle footprint, it does not appear that drilled shafts are a cost effective alternative compared to driven piles.

Driven Piles: Based on our review of available subsurface conditions, the proposed trestle bents are recommended to be founded on driven steel H-piles bearing on the underlying bedrock.

The pile design and the initial pile layout for each bent should be based upon using an allowable stress of 12.6 ksi on HP pile sections, as required by AREMA Section 4.4.3.6. Piles are recommended to be driven vertically, unless pile batter is determined necessary to resist lateral loads. Based on the design loads shown in the pier loading table above, lateral loads will govern the design of pile supported trestle bent foundations.

LPILE by Ensoft was used to develop charts of applied lateral loads versus pile head deflection on a single pile to assist in the final design of trestle foundations. Sample calculations are included in Appendix C showing the parameters used in our analyses as well as the plots of deflection, moment and shear for various applied lateral loads.

Table 5 – Summary of Lpile Analyses (Fixed Head Condition)

Pier Span	Total Vertical Load	Pile Size	Qall/Pile	No. of Piles/Pier	Vertical Load/Pile	Results	
						Max. Horizontal Load	Max. Top Deflection
(ft)	(kips)		(kips)		(kips)	(kips)	(inches)
30	865	HP10X42	156	8	108	14	0.64
	865	HP12X53	195	8	108	21	0.73
	865	HP14X73	269	8	108	32	0.86
	865	HP14X89	328	8	108	39	0.97
	865	HP14X89	328	4	215	33	0.80
40	1,050	HP10X42	156	8	131	12	0.53
	1,050	HP12X53	195	8	131	20	0.69
	1,050	HP14X73	269	8	131	31	0.83
	1,050	HP14X89	328	8	131	38	0.94
	1,050	HP14X89	328	4	256	30	0.71
50	1,276	HP10X42	156	8	160	11	0.48
	1,276	HP12X53	195	8	160	18	0.61
	1,276	HP14X73	269	8	160	29	0.77
	1,276	HP14X89	328	8	160	37	0.92
	1,276	HP14X89	328	4	318	28	0.66

The preliminary geotechnical design of the bent foundations was further advanced by applying lateral loads resulting from longitudinal braking and tractive forces using Ensoft's GROUP 7.0 software. Per AREMA, three load combinations were checked, and Group III (a) and Group III (b) were determined for the span lengths of 30, 40, and 50 feet. Preliminary analyses for 40- and 50-foot spans were performed for the pile supported bents for the most critical Group III (b) loading. A single row of 5 HP 14X89 (50 ksi) piles battered in two directions did not work since the resulting loads and stresses on the piles exceeded the capacity. Hence, a double row of 4 piles, HP 12X53, HP 14X73 and HP 14X89 were analyzed. The 12-inch piles failed because it exceeded the allowable axial load limit of 195 kips, and the deflection at the pile top was more than 1-inch. The 14-inch piles provide desired results as shown in the table below:

Table 6 – Summary of GROUP Analyses

Pier Span	Pile Size	Load Condition	Qall	GROUP Analysis Results				
				Axial Pile Force (kips)		Max. Moment	Max. Pile Stress	Max. Top Deflection
			(kips)	Comp.	Tension	(kips-in)	(ksi)	(inches)
50ft	HP14X89	Group III(b)	328	271	NO	1,720	23.7	0.83
	HP14X73	Group III(b)	269	270	NO	1,690	28.9	0.95
	HP12X53	Group III(b)	195	269	NO	1,650	42.6	1.33
40ft	HP14X89	Group III(b)	328	230	NO	1,510	20.5	0.72
	HP14X73	Group III(b)	269	229	NO	1,480	24.9	0.82
	HP12X53	Group III(b)	195	228	NO	1,420	36.4	1.12

Notes:

1. No pile corrosion was considered.
2. Fixed pile head condition was assumed.
3. The maximum moment and maximum axial force occurs at the pile heads (bottom of the pier cap). Structural engineers should check the structure capacities of the piles at the bottom of pier.

We anticipate that pile tip elevations will range between El. 5 ft and El. 20 ft based on the widely spaced borings drilled in this preliminary phase. Additional borings are required to develop more refined estimates of pile lengths and pile tip elevations.

Pile point reinforcement (shoes) should be used to protect the pile tip when driving through cobbles and boulders, and into the weathered rock.

It is recommended that one production pile should be driven as a test pile at each abutment and pier for the trestle bridge structure. Due to the presence of organic soils and relatively high groundwater levels, we recommend the piles be designed for corrosion protection by including an allowance for 1/16-inch corrosion on the piles.

At-Grade Railroad Tracks

Two segments of railroad tracks within the Hockomock Swamp area, on either side of the trestle, will be constructed at-grade. The two segments are between Stations 1325+50 to 1425+00, and Stations 1510+00 to 1531+00. Preliminary plans show the top of rail to be within 0 to 3 feet of the existing grade. It is recommended that the track subgrade be cleared of all unsuitable organic and fill materials and replaced with structural fill. The structural fill material, where needed, should be free from organics and other deleterious substances and should conform to the requirements listed in the MBTA Standard Specification Section 02200 - Earthwork for Type B Gravel Borrow. The structural fill should be compacted to 95% of the maximum dry density as determined by the Modified Proctor compaction test (ASTM D1557).

Retaining Walls

Lateral earth pressure parameters are required for the design of retaining walls at the approaches to the trestle. The maximum wall height is anticipated to be approximately 5 feet.

The following lateral earth pressures are recommended for retaining walls backfilled with properly compacted materials as defined under fill placement and compaction.

Since the retaining walls that can develop "active" pressures, equivalent fluid pressures of 40 pounds per cubic foot (pcf) should be used for backfill consisting of granular backfill. Additional lateral pressures due to railroad traffic surcharge should also be used.

For passive pressures, an equivalent fluid pressure of 360 pcf should be used. The effects of the top two feet of wall embedment should be ignored in utilizing passive pressure.

It is recommended that the foundation soil has a maximum net allowable pressure of 4 kips per square feet (ksf) and a sliding resistance coefficient of 0.45.

Seismic Consideration

The seismic design should comply with the requirements of the most current Massachusetts State Building Code 780 CMR and other relevant project design codes such as AREMA and AASHTO. Modification of the peak acceleration by the soils overlying bedrock depends upon the type of soil at the site. For the subsurface conditions encountered at the Hockomock Swamp, the site is classified as Seismic Site Class D soil profile in accordance with 780 CMR Chapter 1614.0 Section 9.4 Site Ground Motion. The trestle structure should be designed for the total lateral seismic force using the equations specified in the code, or by the response spectrum method using the design spectra presented in the code. The maximum considered earthquake ground motions shall be as represented by the spectral response acceleration at short periods (Ss) and at 1-sec (S_1) obtained from Table 1604.10 of the Massachusetts State Building Code and adjusted for Site Class effects using the site coefficients of Section 9.4.1.2.4.

For Site Class D Soils at the location of this station:

$S_{MS} = 0.384$ and $S_{M1} = 0.149$

$S_{DS} = 0.256$ and $S_{D1} = 0.099$

where:

- S_{MS} is the maximum consider earthquake spectral response acceleration for short periods adjusted for site class
- S_{M1} is the maximum consider earthquake spectral response acceleration at 1-sec adjusted for site class
- S_{DS} is the design earthquake spectral response acceleration for short periods adjusted for site class
- S_{D1} is the design earthquake spectral response acceleration at 1-sec adjusted for site class

The building code also requires that the soil be evaluated for the following potential hazards: soil liquefaction, or surface rupture due to faulting or lateral spreading. The existing overburden soils do not appear to be subject to surface rupture due to faulting or lateral spreading.

Liquefaction

Jacobs performed an analysis for liquefaction potential of the site. The simplified method described by Youd et al. (2001), and refined by Cetin et al. (2004) was used to assess liquefaction. For the site class D and peak horizontal ground surface acceleration value of 0.110g, and based on the recorded water levels, percentage of fine contents and sample relative densities, obtained from the borings, the existing soils underlying the site are judged to be not susceptible to liquefaction. Further liquefaction analysis is recommended when additional borings are performed for the final design.

CONSTRUCTION CONSIDERATIONS

Foundation Installation – Pile Foundations

Installation of piles should be done per MBTA Standards. Piles should be driven to refusal on the bedrock. No more than one splice should be permitted per pile. Care should be taken in driving piles to hard rock to avoid tip damage. Pile tips should be protected using a cast steel tip. With the hardened tip, we anticipate the piles to penetrate through the boulders without difficulty. Piles should have minimum yield strength of 50 ksi. A relatively small hammer should be used to minimize the risk of pile damage. In our opinion, a hammer with a rated energy of around 15,000 ft-lb per blow would be appropriate for this site.

Subgrade Preparation

Prior to performing any required grading operations and excavations in the proposed at-grade railroad track footprints, the area should be stripped of topsoil, vegetation, and organic silt. Following site clearing, stripping, and required excavations, the exposed subgrade should be proof compacted with 10 passes of a large vibratory drum roller (minimum 10,000 pound static weight). Any pockets of excessively soft, wet or disturbed soil or unsuitable soils should be removed and replaced with properly compacted fill materials.

If additional rolling does not correct the unstable condition as determined by the project geotechnical engineer, the subgrade should be scarified to a depth of at least six inches but not exceeding eighteen inches, aerated, re-compacted, and retested to provide uniform compaction. Following satisfactory compaction of the subgrade, controlled compacted fill material should be placed to bring the site to the required grade.

Fill should not be placed over frozen soil. Soil subgrades should be protected against frost both during and after construction.

Proper drainage of construction areas should be provided to protect the subgrades from the detrimental effects of weather conditions. Excavations should be made with as few passes of the backhoe bucket as possible to reduce disturbance of the subgrade. A backhoe bucket fitted with a smooth blade should be used during the final subgrade preparation, where necessary. The exposed base should be kept free of standing water at all times. The site should be graded to carry any surface runoff away from the work areas.

Fill Placement and Compaction

Fill materials for at-grade construction and for the approach retaining walls most likely will be obtained by importing granular fill materials from off-site borrow sources. However, it may be possible to reuse existing site granular fill material provided that it can be properly placed and compacted. The gradation shall be in accordance with MBTA Standard Specification Section 02200-Earthwork for Type B Gravel Borrow.

All structural fill for the retaining walls and railroad track bed (below the ballast) should be free of organics, demolition debris or other deleterious substances. The fill material should have a plasticity index (PI) less than 4 and a liquid limit (LL) less than 10, and contain fragments less than 4 inches in maximum dimension. Each lift should be compacted to the specified density prior to placing any subsequent lift. All materials to be used as structural fill should be tested in the laboratory to determine their project suitability and compaction characteristics.

The fill should be systematically compacted to 95 percent of the maximum dry density per ASTM D 1557. Soils which exhibit a well-defined moisture content–dry density relationship should be compacted to within plus or minus two percentage points of the optimum moisture content.

Where fill materials are placed against an existing embankment slope, the slope should be benched as the fill is brought up in layers. Benching should be of a sufficient width to permit placing and compaction of fill material upon the existing embankment materials. Typically, benches are between four to eight feet wide. Each bench cut should begin at the intersection of the existing embankment and the vertical side of the previous bench. Trench backfills over pipelines or utility structures should be performed so as not to adversely impact the underlying utilities. In fill areas, the backfill material, compaction method, and degree of compaction requirements should be similar to that for the fill adjacent to the trench.

Construction Dewatering

All excavations should be performed in the dry condition. Discharge of pumped water should be performed in accordance with all federal, state and/or local regulations which may require a discharge permit and possible filtration and chemical testing of the water prior to discharge.

Permanent Slopes

Permanent slopes with loamed and seeded surfaces should not be steeper than 2-1/2 horizontal to 1 vertical (2-1/2H:1V) without slope protection to limit erosion and surficial sloughing of the slope. Additional analyses may be required to assess the stability of slopes steeper than 2-1/2H:1V as the area design is finalized.

Excavation Slopes and Shoring

The slopes of temporary open cuts should be no steeper than 1-1/2H:1V. Open cuts should not be used below the water table because of the likelihood of soil sloughing into the excavation.

The temporary excavation support system, if needed, should be selected by the Contractor and designed by an experienced Professional Engineer registered in the Commonwealth of Massachusetts and retained by the Contractor. Where excavation sides can be sloped back, they should be performed in accordance with the Occupational Safety and Health Administration (OSHA) Construction Industry Standards.

CLOSING

This report and the recommendations contained herein have been prepared for the exclusive use of MBTA and VHB and their representatives for specific application to the design and construction of the proposed trestle and at-grade railroad tracks at the Hockomock Swamp in Raynham, Massachusetts.

This report was prepared in accordance with generally accepted soil and foundation engineering practices. No warranty, expressed or implied, is made. The analysis, design and recommendations submitted in this report are based in part upon the data obtained from subsurface explorations available at the time of this report. Subsurface stratification variations between borings are anticipated. The reported groundwater levels only represent the water levels at the time noted on the logs. The nature and extent of variations between these explorations may not become evident until construction. If significant variations then appear, or if there

are changes in the nature, design or location of the proposed structure, it may be necessary to reevaluate the recommendations of this report.

Tested By:	daa
Checked By:	mpd

Bulk Density and Compressive Strength of Rock Core Specimens by ASTM D 7012 Method C

Boring ID	Sample ID	Depth, ft	Bulk Density, lb/ft^3	Compressive Strength, psi	Failure Type	In conformance with ASTM D 4543
HS-4	C-1	---	170	6,500	1	YES
HST-2	C-2	---	Sample too short to test			
HST-3	C-2	---	159	7,822	1	YES
HST-5	C-1	---	Sample too short to test			
HST-7	C-1	---	167	4,693	1	YES
HST-8	C-1	---	162	6,689	1	NO *,**

Notes:

Density determined on core samples by measuring dimensions and weight and then calculating.

All specimens tested at the approximate as-received moisture content and at standard laboratory temperature.

Failure Type: 1 = Intact Material Failure; 2 = Discontinuity Failure (See attached photographs)

* The as-received core did not meet the ASTM side straightness tolerance.

** Specimen L/D < 2. Compressive Strength reported is the computed compressive strength of an equivalent L/D = 2 specimen. The value is corrected using the following equation from ASTM D 2938-86:

$$C = C_a/(0.88+(0.24b/h))$$

where:

C = computed compressive Strength for L/D = 2

C_a = measured compressive strength

b = test core diameter

h = test core height

Memorandum

APPENDIX C: GEOTECHNICAL CALCULATIONS

LPile Analyses
Pile GROUP Analyses
Seismic Site Class Evaluation
Liquefaction Analyses

LPile Analyses

Purpose:

The purpose of this calculation is to analyze a single pile response (no group reduction) in the longitudinal direction of the proposed Hockomock Swamp Trestle.

References:

- AREMA Manual.

Assumptions:

- **Boring**

By examining the Borings of HST-1 to HST-9 in areas of the proposed trestle, Boring HST-4 was used for the following analyses.

Boring HST-4 Location: Sta.1457+00
Ground Elevation: EL.70.5

- **Ground water table:**

It is assumed that the ground water at EL 70.5

- **Superstructure**

Top of Track: EL.79.7
Top of Pier Cap: EL.74.2
Bottom of Pier Cap: EL.70.7

- **Pile Size**

Four sizes of HP piles were analyzed. In accordance with AREMA, the maximum allowable pile stresses should be limited to 12.6 ksi for a pile with yield strength of 36 ksi. The maximum allowable single pile capacity was estimated for each size of the HP piles as well as the relevant properties as follows:

Pile Size	As	Ix	Sx	Iy	Sy	Qall
	(in^2)	(in^4)	(in^3)	(in^4)	(in^3)	(kips)
HP10X42	12.4	210	43.4	71.7	14.2	156
HP12X53	15.5	393	66.7	127	21.1	195
HP14X73	21.4	729	107	261	35.8	269
HP14X89	26.1	904	131	326	44.3	328

Elastic Modulus: E = 29,000,000 psi

- **Load From Structure**

The service loads for pier span of 30 ft, 40 ft and 50 ft were obtained from Kristofer Kretsch (email on 2/02/2012). The longitudinal force due to braking and traction were based on the email from Kristofer Kretsch on 2/24/2012.

All the loads were summarized as follows (Referring to the Computations by KGK dated on 2/23/2012)

Pier Span	Dead Load, D*	Live Load, L	Impact Load, I	Longitudinal Braking			Longitudinal Traction		
				Force, LF_B	Moment,M_B**	Vertical, V_B	Force, LF_T	Moment,M_T**	Vert., V_T
(ft)	(kips)	(kips)	(kips)	(kips)	(k-ft)	(kips)	(kips)	(k-ft)	(kips)
30	330	346	142	81	1,235	41	137	1,404	47
40	425	432	153	93	1,418	35	158	1,620	40
50	520	546	174	105	1,601	32	177	1,814	36

Note: * Dead load includes weight of pier cap (50 kips for single row of piles).

** The moments are about the center of the pier cap. The moment is applied to the piers as a vertical couple applied downward on the pier at one end of the span and upward on the pier at the other end of the span. The moment is not applied directly to the pier cap, but is only given for information.

- **Load Combination**

As per AREMA, three load combinations were checked:

Group I = D + L + I

Group III (a) = D + L + I + LF_B Including longitudinal braking load

Group III(b) = D + L + I + LF_T Including longitudinal traction load

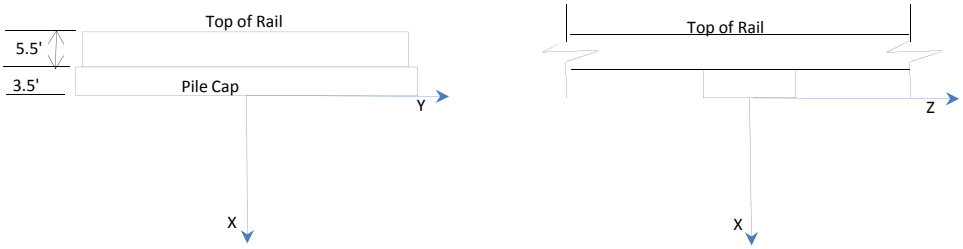
No other loads were considered at present.

The load combinations of Group III(a) and Group III(b) with respect to the following coordinate system are more critical. Therefore, only these two load combinations were summarized as follows:

Pier Span	Load Combination	Fx		Fy	Fz
		Single Row	Double Row*		
(ft)		(kips)	(kips)	(kips)	(kips)
30	Group III(a)	859	909	0	81
	Group III(b)	865	915	0	137
40	Group III(a)	1,045	1,095	0	93
	Group III(b)	1,050	1,100	0	158
50	Group III(a)	1,272	1,322	0	105
	Group III(b)	1,276	1,326	0	177

Note: * For double rows of piles, the pile cap weight is 100k.

Coordinate system:



Analysis:

Software: LPILE Plus 5.0 (Ensoft, Inc.)

Analysis:

By checking the above load combinations, Group III(b) is critical for all three pier spans. The following analyses were based on this load combination only.

Single pile responses under load combination Group III(b) were analyzed assuming that the pile head are fixed in the pile cap which is 3.5 feet deep. The axial load of a single pile was estimated based on 4 piles of a single row and 8 piles of double rows. **No moment was applied at the top of the pile.**

The results were summarized in the next page.

The attachments include Lateral Load vs. Pile-head Deflection, Lateral Deflection vs. Depth, Bending Moment vs. Depth and Shear Force vs. Depth for each loading case.

These results are for preliminary pile layout. Once the preliminary pile layout is available, the pile group analyses should be performed with all the loads applied at the bottom of the pile cap.

Summary of Lpile Analyses (Fixed Head Condition)

Pier Span	Total Vertical Load	Pile Size	Qall/Pile	No. of Piles/Pier	Vertical Load/Pile	Results	
						Max. Horizontal Load	Max. Top Deflection
(ft)	(kips)		(kips)		(kips)	(kips)	(inches)
30	865	HP10X42	156	8	108	14	0.64

Pile GROUP Analyses

Purpose:

The purpose of this calculation is to perform preliminary pile group analysis of a typical deep foundation of the proposed Hockomock Swamp Trestle.

References:

- AREMA Manual.

Assumptions:

- **Boring**

By examining the Borings of HST-1 to HST-9 in areas of the proposed trestle, Boring HST-4 was used for the following analyses.

Boring HST-4 Location: Sta.1457+00
Ground Elevation: EL.70.5

- **Ground water table:**

It is assumed that the ground water at EL 70.5

- **Superstructure**

Top of Track: EL.79.7
Top of Pier Cap: EL.74.2
Bottom of Pier Cap: EL.70.7

- **Pile Size**

Four sizes of HP piles were analyzed. In accordance with AREMA, the maximum allowable pile stresses should be limited to 12.6 ksi for a pile with yield strength of 36 ksi. The maximum allowable single pile capacity was estimated for each size of the HP piles as well as the relevant properties as follows:

Pile Size	As (in^2)	Ix (in^4)	Sx (in^3)	Iy (in^4)	Sy (in^3)	Qall (kips)	J (in^4)	GJ ($lbs\text{-}in^2$)
HP10X42	12.4	210	43.4	71.7	14.2	156	0.81	9,034,615
HP12X53	15.5	393	66.7	127	21.1	195	1.12	12,492,308
HP14X73	21.4	729	107	261	35.8	269	2.01	22,419,231
HP14X89	26.1	904	131	326	44.3	328	3.6	40,153,846

Elastic Modulus: E = 29,000,000 psi

Shear Modulus: $G = \frac{E}{2(1+\nu)}$ = 11,153,846 psi

where ν= 0.3

- **Pile Corrosion**

No pile corrosion is considered for preliminary design. However, pile corrosion should be considered for final design.

- **Load From Structure**

The service loads for pier span of 30 ft, 40 ft and 50 ft were obtained from Kristofer Kretsch (email on 2/02/2012). The longitudinal forces due to braking and traction were based on the email from Kristofer Kretsch on 2/24/2012.

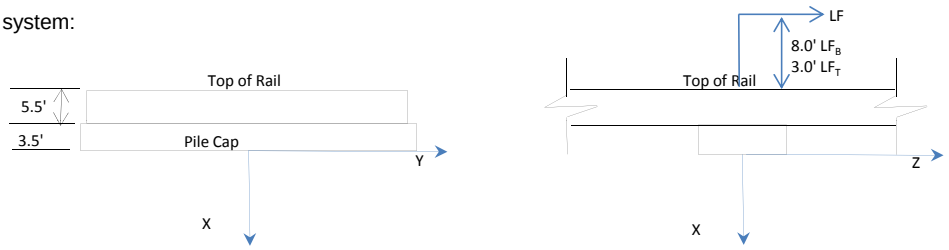
All the loads were summarized as follows (Referring to the Computations by KGK dated on 2/23/2012)

Pier Span	Dead Load, D*	Live Load, L	Impact Load, I	Longitudinal Braking			Longitudinal Traction		
				Force, LF_B	Moment,M_B**	Vertical, V_B	Force, LF_T	Moment,M_T**	Vert., V_T
(ft)	(kips)	(kips)	(kips)	(kips)	(k-ft)	(kips)	(kips)	(k-ft)	(kips)
30	330	346	142	81	1,235	41	137	1,404	47
40	425	432	153	93	1,418	35	158	1,620	40
50	520	546	174	105	1,601	32	177	1,814	36

Note: * Dead load includes weight of pier cap (50 kips for single row of piles).

** The moments are about the center of the pier cap. The moment is applied to the piers as a vertical couple applied downward on the pier at one end of the span and upward on the pier at the other end of the span. The moment is not applied directly to the pier cap, but is only given for information.

Coordinate system:



To perform GROUP analysis, all the loads should be transferred to the bottom of the pier cap. It was assumed that the longitudinal forces LF_B and LF_T are applied at the top of the pier cap through the bearing pads. When the longitudinal forces are transferred to the bottom of the pier, the above Table should be revised as follows:

Revised loads at the bottom of the pier cap

Pier Span	Dead Load, D	Live Load, L	Impact Load, I	Longitudinal Braking			Longitudinal Traction		
				Force, LF_B	Moment,M_B*	Vertical, V_B	Force, LF_T	Moment,M_T*	Vert., V_T
(ft)	(kips)	(kips)	(kips)	(kips)	(k-ft)	(kips)	(kips)	(k-ft)	(kips)
30	330	346	142	81	1,094	36	137	1,165	39
40	425	432	153	93	1,256	31	158	1,343	34
50	520	546	174	105	1,418	28	177	1,505	30

Note: * The moment is applied to the piers as a vertical couple applied downward on the pier at one end of the span and upward on the pier at the other end of the span. The moment is not applied directly to the pier cap, but is only given for information.

- **Load Combination**

As per AREMA, three load combinations were checked:

Group I = D + L + I

Group III (a) = D + L + I + LF_B with Longitudinal braking load

Group III(b) = D + L + I + LF_T with longitudinal traction load

No other loads were considered at present.

Assuming that the Superstructure and track height is 5.5 ft and pier cap height is 3.5 ft based on the email from Kristofer Kretsch, the load combinations of Group III(a) and Group III(b) with respect to the above coordinate system are more critical. Therefore, only these two load combinations were summarized as follows:

Pier Span	Load Comb.	Force				Moment		
		Fx		Fy	Fz	Mx	My*	Mz
		Single Row	Double Row					
(ft)		(lbs)	(lbs)	(lbs)	(lbs)	(lbs-in)	(lbs-in)	(lbs-in)
30	Group III(a)	854,450	904,450	0	81,000	0	3,402,000	0
	Group III(b)	856,817	906,817	0	137,000	0	5,754,000	0
40	Group III(a)	1,041,388	1,091,388	0	93,000	0	3,906,000	0
	Group III(b)	1,043,575	1,093,575	0	158,000	0	6,636,000	0
50	Group III(a)	1,268,350	1,318,350	0	105,000	0	4,410,000	0
	Group III(b)	1,270,090	1,320,090	0	177,000	0	7,434,000	0

Note: * *My* was calculated with respect to the bottom of the pier cap.

Analysis:

Software: GROUP 7.0 (Ensoft, Inc.)

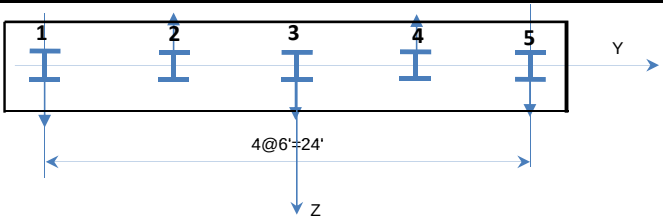
Analysis:

By checking the above load combinations, Group III(b) is critical for all three pier spans. The following analyses were based on this load combination only.

1. Single Row of Piles Layout

Only pier span equal to 50 ft was analyzed.

Assuming a row of 5 HP14X89 piles is used, and each pile is tilted at 1H:12V as follows:



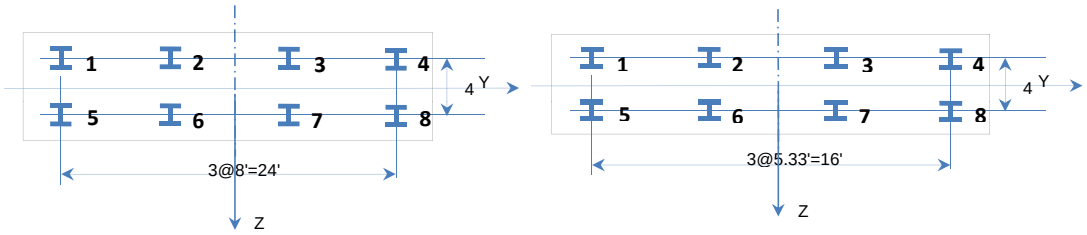
The results with respect to the adjusted moments are as follows:

Maximum axial compression force:	547	kips	>328 kips, NG
Maximum axial tension force:	191	kips	>76 kips, NG
Maximum stress in pile:	68	ksi	Overstressed, NG
Maximum pile top deflection	3.1	inches	Too high, NG

Therefore, one row of piles does not work.

2. Double Rows of Piles Layout

Assuming two rows of vertical piles were used. The trestle width of 28 ft and 20 ft were analyzed.



Three sizes of piles were checked. The results were summarized in the following tables:

Summary of GROUP Analyses (Fixed Head Condition) - 28 ft Wide Trestle

Pier Span	Pile Size	Load Condition	Qall	GROUP Analysis Results				
				Axial Pile Force (kips)		Max. Moment	Max. Pile Stress	Max. Top Deflection
(ft)			(kips)	Comp..	Tension	(kips-in)	(ksi)	(inches)
50ft	HP14X89	Group III(b)	328	271	NO	1,700	23.5	0.82
	HP14X73	Group III(b)	269	270	NO	1,670	28	0.94
	HP12X53	Group III(b)	195	269	NO	1,650	42.5	1.33
40ft	HP14X89	Group III(b)	328	230	NO	1,490	20.3	0.71
	HP14X73	Group III(b)	269	220	NO	1,460	24.7	0.81
	HP12X53	Group III(b)	195	228	NO	1,420	36.4	1.12

Summary of GROUP Analyses (Fixed Head Condition) - 20 ft Wide Trestle

Pier Span	Pile Size	Load Condition	Qall	GROUP Analysis Results				
				Axial Pile Force (kips)		Max. Moment	Max. Pile Stress	Max. Top Deflection
(ft)			(kips)	Comp..	Tension	(kips-in)	(ksi)	(inches)
50ft	HP14X89	Group III(b)	328	271	NO	1,720	23.7	0.83
	HP14X73	Group III(b)	269	270	NO	1,690	28.9	0.95
	HP12X53	Group III(b)	195	269	NO	1,650	42.6	1.33
40ft	HP14X89	Group III(b)	328	230	NO	1,510	20.5	0.72
	HP14X73	Group III(b)	269	229	NO	1,480	24.9	0.82
	HP12X53	Group III(b)	195	228	NO	1,420	36.4	1.12

Note:

1. No pile corrosion was considered.
2. Fixed pile head condition was assumed.
3. The maximum moment and maximum axial force occur at the pile heads (bottom of the pier cap).
   Structural engineers should check the structural capacities of the piles at the bottom of pier connection.

	Total Depth =	100			
	Depth to Bedrock =	60	sum	6.46	

Approx. Project Coordinates

Lat 41.999792
Long -71.080808

Seismic Coefficients

S_S = 0.24 (Table 1604.10*)
S_1 = 0.062 (Table 1604.10*)

For Site Class D

F_A = 1.6 (See Table 9.4.1.2.4a*)
F_V = 2.4 (See Table 9.4.1.2.4b*)

$S_{MS} = Ss \times F_A$ = 0.384
$S_{M1} = S_1 \times F_V$ = 0.149

$S_{DS} = 2/3 \times S_{MS}$ = 0.256
$S_{D1} = 2/3 \times S_{M1}$ = 0.099

Per 9.4.1.2.1, $15 \le N_{bar} \le 50$, Site Class D

9.4.1.2.1 Site Class Definitions. The site shall be classified as one of the following classes:

A = Hard rock with measured shear wave velocity, $\overline{v}_s$ > 5000ft/s (1500 m/s)

B = Rock with 2500 ft/s < $\overline{v}_s$ ≤5000 ft/s (760 m/s < $\overline{v}_s$ ≤ 1500 m/s)

C = Very dense soil and soft rock with 1200 ft/s ≤ $\overline{v}_s$ ≤ 2500 ft/s (370 m/s ≤ $\overline{v}_s$ ≤ 760 m/s) or $\overline{N}$ or $\overline{N}_{ch}$ > 50 or $\overline{s}_u$ ≥ 2000 psf (100 kPa)

D = Stiff soil with 600 ft/s ≤ $\overline{v}_s$ ≤ 1200 ft/s (180 m/s ≤ $\overline{v}_s$ ≤ 370 m/s) or with 15 ≤ $\overline{N}$ or $\overline{N}_{ch}$ ≤ 50 or 1000 psf ≤ $\overline{s}_u$ ≤ 2000 psf (50 kPa ≤ $\overline{s}_u$ ≤ 100 kPa)

E = A soil profile with $\overline{v}_s$ < 600 ft/s (180 m/s) or any profile with more than 10 ft (3 m) of soft clay. Soft clay is defined as soil with *PI* > 20, *w* ≥ 40%, and s_u < 500 psf (25 kPa)

F = Soils requiring site-specific evaluations:

1. Soils vulnerable to potential failure or collapse under seismic loading such as liquefiable soils, quick and highly sensitive clays, collapsible weakly cemented soils. Potential for liquefaction shall be evaluated in accordance with 780 CMR 1804.6: *Liquefaction.*

Exception. None.

2. Peats and/or highly organic clays (*H* > 10 ft [3 m] of peat and/or highly organic clay where *H* = thickness of soil).
3. Very high plasticity clays (H > 25 ft [7.6 m] with *PI* > 75).
4. Very thick soft/medium stiff clays (H>120 ft [37 m].

Exception. None.

Notes: * The Massachusetts State Building Code, 8th Edition (2010)

TABLE 9.4.1.2.4a VALUES OF F_a AS A FUNCTION OF SITE CLASS AND SHORT PERIOD MAXIMUM CONSIDERED EARTHQUAKE SPECTRAL ACCELERATION

Summary statistics for above PSHA PGA deaggregation, R=distance, e=epsilon:
Mean src-site R= 81.2 km; M= 5.79; eps0= -0.10. Mean calculated for all sources.
Modal src-site R= 17.2 km; M= 4.80; eps0= -1.18 from peak (R,M) bin

Gridded source distance metrics: Rseis Rrup and Rjb
MODE R*= 35.8km; M*= 5.03; EPS.INTERVAL: 0 to 1 sigma % CONTRIB.= 2.282

Principal sources (faults, subduction, random seismicity having >10% contribution)

Source Category:	% contr.	R(km)	M	epsilon0 (mean values)
CEUS gridded seism.	100.00	81.2	5.79	-0.10

Individual fault hazard details if contrib.>1%:

Checklist for Stormwater Report

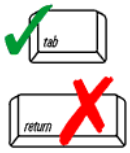
A. Introduction

Important: When filling out forms on the computer, use only the tab key to move your cursor - do not use the return key.



A Stormwater Report must be submitted with the Notice of Intent permit application to document compliance with the Stormwater Management Standards. The following checklist is NOT a substitute for the Stormwater Report (which should provide more substantive and detailed information) but is offered here as a tool to help the applicant organize their Stormwater Management documentation for their Report and for the reviewer to assess this information in a consistent format. As noted in the Checklist, the Stormwater Report must contain the engineering computations and supporting information set forth in Volume 3 of the Massachusetts Stormwater Handbook. The Stormwater Report must be prepared and certified by a Registered Professional Engineer (RPE) licensed in the Commonwealth.

The Stormwater Report must include:

- The Stormwater Checklist completed and stamped by a Registered Professional Engineer (see page 2) that certifies that the Stormwater Report contains all required submittals.[1] This Checklist is to be used as the cover for the completed Stormwater Report.
- Applicant/Project Name
- Project Address
- Name of Firm and Registered Professional Engineer that prepared the Report
- Long-Term Pollution Prevention Plan required by Standards 4-6
- Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan required by Standard 8[2]
- Operation and Maintenance Plan required by Standard 9

In addition to all plans and supporting information, the Stormwater Report must include a brief narrative describing stormwater management practices, including environmentally sensitive site design and LID techniques, along with a diagram depicting runoff through the proposed BMP treatment train. Plans are required to show existing and proposed conditions, identify all wetland resource areas, NRCS soil types, critical areas, Land Uses with Higher Potential Pollutant Loads (LUHPPL), and any areas on the site where infiltration rate is greater than 2.4 inches per hour. The Plans shall identify the drainage areas for both existing and proposed conditions at a scale that enables verification of supporting calculations.

As noted in the Checklist, the Stormwater Management Report shall document compliance with each of the Stormwater Management Standards as provided in the Massachusetts Stormwater Handbook. The soils evaluation and calculations shall be done using the methodologies set forth in Volume 3 of the Massachusetts Stormwater Handbook.

To ensure that the Stormwater Report is complete, applicants are required to fill in the Stormwater Report Checklist by checking the box to indicate that the specified information has been included in the Stormwater Report. If any of the information specified in the checklist has not been submitted, the applicant must provide an explanation. The completed Stormwater Report Checklist and Certification must be submitted with the Stormwater Report.

[1] The Stormwater Report may also include the Illicit Discharge Compliance Statement required by Standard 10. If not included in the Stormwater Report, the Illicit Discharge Compliance Statement must be submitted prior to the discharge of stormwater runoff to the post-construction best management practices.

[2] For some complex projects, it may not be possible to include the Construction Period Erosion and Sedimentation Control Plan in the Stormwater Report. In that event, the issuing authority has the discretion to issue an Order of Conditions that approves the project and includes a condition requiring the proponent to submit the Construction Period Erosion and Sedimentation Control Plan before commencing any land disturbance activity on the site.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

B. Stormwater Checklist and Certification

The following checklist is intended to serve as a guide for applicants as to the elements that ordinarily need to be addressed in a complete Stormwater Report. The checklist is also intended to provide conservation commissions and other reviewing authorities with a summary of the components necessary for a comprehensive Stormwater Report that addresses the ten Stormwater Standards.

Note: Because stormwater requirements vary from project to project, it is possible that a complete Stormwater Report may not include information on some of the subjects specified in the Checklist. If it is determined that a specific item does not apply to the project under review, please note that the item is not applicable (N.A.) and provide the reasons for that determination.

A complete checklist must include the Certification set forth below signed by the Registered Professional Engineer who prepared the Stormwater Report.

Registered Professional Engineer's Certification

I have reviewed the Stormwater Report, including the soil evaluation, computations, Long-term Pollution Prevention Plan, the Construction Period Erosion and Sedimentation Control Plan (if included), the Long-term Post-Construction Operation and Maintenance Plan, the Illicit Discharge Compliance Statement (if included) and the plans showing the stormwater management system, and have determined that they have been prepared in accordance with the requirements of the Stormwater Management Standards as further elaborated by the Massachusetts Stormwater Handbook. I have also determined that the information presented in the Stormwater Checklist is accurate and that the information presented in the Stormwater Report accurately reflects conditions at the site as of the date of this permit application.

Signature and Date

Checklist

Project Type: Is the application for new development, redevelopment, or a mix of new and redevelopment?

☐ New development

☐ Redevelopment

☒ Mix of New Development and Redevelopment

Checklist for Stormwater Report

Checklist (continued)

LID Measures: Stormwater Standards require LID measures to be considered. Document what environmentally sensitive design and LID Techniques were considered during the planning and design of the project:

- ☐ No disturbance to any Wetland Resource Areas
- ☐ Site Design Practices (e.g. clustered development, reduced frontage setbacks)
- ☐ Reduced Impervious Area (Redevelopment Only)
- ☐ Minimizing disturbance to existing trees and shrubs
- ☐ LID Site Design Credit Requested:
  - ☐ Credit 1
  - ☐ Credit 2
  - ☐ Credit 3
- ☐ Use of "country drainage" versus curb and gutter conveyance and pipe
- ☒ Bioretention Cells (includes Rain Gardens)
- ☐ Constructed Stormwater Wetlands (includes Gravel Wetlands designs)
- ☐ Treebox Filter
- ☐ Water Quality Swale
- ☒ Grass Channel
- ☐ Green Roof
- ☐ Other (describe): _____

Standard 1: No New Untreated Discharges

- ☒ No new untreated discharges
- ☐ Outlets have been designed so there is no erosion or scour to wetlands and waters of the Commonwealth
- ☐ Supporting calculations specified in Volume 3 of the Massachusetts Stormwater Handbook included.

Checklist for Stormwater Report

Checklist (continued)

Standard 2: Peak Rate Attenuation

☐ Standard 2 waiver requested because the project is located in land subject to coastal storm flowage and stormwater discharge is to a wetland subject to coastal flooding.

☐ Evaluation provided to determine whether off-site flooding increases during the 100-year 24-hour storm.

☒ Calculations provided to show that post-development peak discharge rates do not exceed pre-development rates for the 2-year and 10-year 24-hour storms. If evaluation shows that off-site flooding increases during the 100-year 24-hour storm, calculations are also provided to show that post-development peak discharge rates do not exceed pre-development rates for the 100-year 24-hour storm.

Standard 3: Recharge

☐ Soil Analysis provided.

☒ Required Recharge Volume calculation provided.

☐ Required Recharge volume reduced through use of the LID site Design Credits.

☒ Sizing the infiltration, BMPs is based on the following method: Check the method used.

☒ Static ☐ Simple Dynamic ☐ Dynamic Field[1]

☒ Runoff from all impervious areas at the site discharging to the infiltration BMP.

☐ Runoff from all impervious areas at the site is *not* discharging to the infiltration BMP and calculations are provided showing that the drainage area contributing runoff to the infiltration BMPs is sufficient to generate the required recharge volume.

☒ Recharge BMPs have been sized to infiltrate the Required Recharge Volume.

☐ Recharge BMPs have been sized to infiltrate the Required Recharge Volume *only* to the maximum extent practicable for the following reason:

- ☐ Site is comprised solely of C and D soils and/or bedrock at the land surface
- ☐ M.G.L. c. 21E sites pursuant to 310 CMR 40.0000
- ☐ Solid Waste Landfill pursuant to 310 CMR 19.000
- ☐ Project is otherwise subject to Stormwater Management Standards only to the maximum extent practicable.

☒ Calculations showing that the infiltration BMPs will drain in 72 hours are provided.

☐ Property includes a M.G.L. c. 21E site or a solid waste landfill and a mounding analysis is included.

[1] 80% TSS removal is required prior to discharge to infiltration BMP if Dynamic Field method is used.

Checklist (continued)

Standard 3: Recharge (continued)

☐ The infiltration BMP is used to attenuate peak flows during storms greater than or equal to the 10-year 24-hour storm and separation to seasonal high groundwater is less than 4 feet and a mounding analysis is provided.

☐ Documentation is provided showing that infiltration BMPs do not adversely impact nearby wetland resource areas.

Standard 4: Water Quality

The Long-Term Pollution Prevention Plan typically includes the following:

- Good housekeeping practices;
- Provisions for storing materials and waste products inside or under cover;
- Vehicle washing controls;
- Requirements for routine inspections and maintenance of stormwater BMPs;
- Spill prevention and response plans;
- Provisions for maintenance of lawns, gardens, and other landscaped areas;
- Requirements for storage and use of fertilizers, herbicides, and pesticides;
- Pet waste management provisions;
- Provisions for operation and management of septic systems;
- Provisions for solid waste management;
- Snow disposal and plowing plans relative to Wetland Resource Areas;
- Winter Road Salt and/or Sand Use and Storage restrictions;
- Street sweeping schedules;
- Provisions for prevention of illicit discharges to the stormwater management system;
- Documentation that Stormwater BMPs are designed to provide for shutdown and containment in the event of a spill or discharges to or near critical areas or from LUHPPL;
- Training for staff or personnel involved with implementing Long-Term Pollution Prevention Plan;
- List of Emergency contacts for implementing Long-Term Pollution Prevention Plan.

☐ A Long-Term Pollution Prevention Plan is attached to Stormwater Report and is included as an attachment to the Wetlands Notice of Intent.

☒ Treatment BMPs subject to the 44% TSS removal pretreatment requirement and the one inch rule for calculating the water quality volume are included, and discharge:

- ☐ is within the Zone II or Interim Wellhead Protection Area
- ☐ is near or to other critical areas
- ☐ is within soils with a rapid infiltration rate (greater than 2.4 inches per hour)
- ☒ involves runoff from land uses with higher potential pollutant loads.

☐ The Required Water Quality Volume is reduced through use of the LID site Design Credits.

☒ Calculations documenting that the treatment train meets the 80% TSS removal requirement and, if applicable, the 44% TSS removal pretreatment requirement, are provided.

Checklist for Stormwater Report

Checklist (continued)

Standard 4: Water Quality (continued)

☒ The BMP is sized (and calculations provided) based on:

- ☒ The ½" or 1" Water Quality Volume or
- ☐ The equivalent flow rate associated with the Water Quality Volume and documentation is provided showing that the BMP treats the required water quality volume.

☐ The applicant proposes to use proprietary BMPs, and documentation supporting use of proprietary BMP and proposed TSS removal rate is provided. This documentation may be in the form of the propriety BMP checklist found in Volume 2, Chapter 4 of the Massachusetts Stormwater Handbook and submitting copies of the TARP Report, STEP Report, and/or other third party studies verifying performance of the proprietary BMPs.

☐ A TMDL exists that indicates a need to reduce pollutants other than TSS and documentation showing that the BMPs selected are consistent with the TMDL is provided.

Standard 5: Land Uses With Higher Potential Pollutant Loads (LUHPPLs)

☐ The NPDES Multi-Sector General Permit covers the land use and the Stormwater Pollution Prevention Plan (SWPPP) has been included with the Stormwater Report.

☐ The NPDES Multi-Sector General Permit covers the land use and the SWPPP will be submitted ***prior to*** the discharge of stormwater to the post-construction stormwater BMPs.

☒ The NPDES Multi-Sector General Permit does ***not*** cover the land use.

☐ LUHPPLs are located at the site and industry specific source control and pollution prevention measures have been proposed to reduce or eliminate the exposure of LUHPPLs to rain, snow, snow melt and runoff, and been included in the long term Pollution Prevention Plan.

☐ All exposure has been eliminated.

☐ All exposure has ***not*** been eliminated and all BMPs selected are on MassDEP LUHPPL list.

☒ The LUHPPL has the potential to generate runoff with moderate to higher concentrations of oil and grease (e.g. all parking lots with >1000 vehicle trips per day) and the treatment train includes an oil grit separator, a filtering bioretention area, a sand filter or equivalent.

Standard 6: Critical Areas

☐ The discharge is near or to a critical area and the treatment train includes only BMPs that MassDEP has approved for stormwater discharges to or near that particular class of critical area.

☐ Critical areas and BMPs are identified in the Stormwater Report.

Checklist for Stormwater Report

Checklist (continued)

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the maximum extent practicable

☒ The project is subject to the Stormwater Management Standards only to the maximum Extent Practicable as a:

- ☐ Limited Project
- ☐ Small Residential Projects: 5-9 single family houses or 5-9 units in a multi-family development provided there is no discharge that may potentially affect a critical area.
- ☐ Small Residential Projects: 2-4 single family houses or 2-4 units in a multi-family development with a discharge to a critical area
- ☐ Marina and/or boatyard provided the hull painting, service and maintenance areas are protected from exposure to rain, snow, snow melt and runoff
- ☐ Bike Path and/or Foot Path
- ☐ Redevelopment Project
- ☒ Redevelopment portion of mix of new and redevelopment.

☐ Certain standards are not fully met (Standard No. 1, 8, 9, and 10 must always be fully met) and an explanation of why these standards are not met is contained in the Stormwater Report.

☐ The project involves redevelopment and a description of all measures that have been taken to improve existing conditions is provided in the Stormwater Report. The redevelopment checklist found in Volume 2 Chapter 3 of the Massachusetts Stormwater Handbook may be used to document that the proposed stormwater management system (a) complies with Standards 2, 3 and the pretreatment and structural BMP requirements of Standards 4-6 to the maximum extent practicable and (b) improves existing conditions.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control

A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan must include the following information:

- Narrative;
- Construction Period Operation and Maintenance Plan;
- Names of Persons or Entity Responsible for Plan Compliance;
- Construction Period Pollution Prevention Measures;
- Erosion and Sedimentation Control Plan Drawings;
- Detail drawings and specifications for erosion control BMPs, including sizing calculations;
- Vegetation Planning;
- Site Development Plan;
- Construction Sequencing Plan;
- Sequencing of Erosion and Sedimentation Controls;
- Operation and Maintenance of Erosion and Sedimentation Controls;
- Inspection Schedule;
- Maintenance Schedule;
- Inspection and Maintenance Log Form.

☒ A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan containing the information set forth above has been included in the Stormwater Report.

Checklist for Stormwater Report

Checklist (continued)

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control (continued)

☐ The project is highly complex and information is included in the Stormwater Report that explains why it is not possible to submit the Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan with the application. A Construction Period Pollution Prevention and Erosion and Sedimentation Control has ***not*** been included in the Stormwater Report but will be submitted ***before*** land disturbance begins.

☐ The project is ***not*** covered by a NPDES Construction General Permit.

☐ The project is covered by a NPDES Construction General Permit and a copy of the SWPPP is in the Stormwater Report.

☒ The project is covered by a NPDES Construction General Permit but no SWPPP been submitted. The SWPPP will be submitted BEFORE land disturbance begins.

Standard 9: Operation and Maintenance Plan

☒ The Post Construction Operation and Maintenance Plan is included in the Stormwater Report and includes the following information:

- ☐ Name of the stormwater management system owners;
- ☐ Party responsible for operation and maintenance;
- ☐ Schedule for implementation of routine and non-routine maintenance tasks;
- ☐ Plan showing the location of all stormwater BMPs maintenance access areas;
- ☐ Description and delineation of public safety features;
- ☐ Estimated operation and maintenance budget; and
- ☐ Operation and Maintenance Log Form.

☐ The responsible party is ***not*** the owner of the parcel where the BMP is located and the Stormwater Report includes the following submissions:

- ☐ A copy of the legal instrument (deed, homeowner's association, utility trust or other legal entity) that establishes the terms of and legal responsibility for the operation and maintenance of the project site stormwater BMPs;
- ☐ A plan and easement deed that allows site access for the legal entity to operate and maintain BMP functions.

Standard 10: Prohibition of Illicit Discharges

☒ The Long-Term Pollution Prevention Plan includes measures to prevent illicit discharges;

☐ An Illicit Discharge Compliance Statement is attached;

☐ NO Illicit Discharge Compliance Statement is attached but will be submitted ***prior to*** the discharge of any stormwater to post-construction BMPs.

Stormwater Report Narrative

This Stormwater Report has been prepared to demonstrate compliance with the Massachusetts Stormwater Management Standards in accordance with the Massachusetts Wetlands Protection Act Regulations (310 CMR 10.00) and Water Quality Certification Regulations (314 CMR 9.00).

Project Description

The Applicant, Massachusetts Bay Transportation Authority, is proposing to construct a train station located at 21 Washington Street Stoughton and Easton, Massachusetts. This station will be known as the North Easton Station and is proposed along the existing Stoughton Railroad Line (the Project). As proposed, the Project consists of approximately 10.0-acres of land acquisition, of which approximately 9-acres will be developed for the new station.

The Project will entail the construction of a center platform with canopy, a parking lot with 506 spaces, access driveway, a bus stop drop-off area, a center platform, sidewalks, stairs and ramps associated with access from the parking lot to the platform, bicycle parking facilities, retaining walls and stormwater infrastructure.

The site is considered a Land Use with Higher Potential Pollutant Loads (LUHPPL) as defined in 310 CMR 10.04 and 314 CMR 9.02 because it is a parking lot with a high-intensity use (1,000 vehicle trips per day or more).

Site Description

The Project Site is located at 21 Washington Street on the Stoughton/Easton Town line in Massachusetts. The Site is bounded by undeveloped land to the north, a wetland to the south, office buildings to the east, and the existing but abandoned Stoughton Line tracks to the west. See Figure 1, Site Locus Map.

Wetland Resource Areas on the Site, shown on Figures 3 and 4, are described in Table 1. For additional information regarding the wetland resource areas present on the site see the Abbreviated Notice of Resource Area Delineation prepared by VHB dated May 2011.

Table 1:
Wetland Resource Areas

Name	*Critical Area*	*Zone 1 or Zone A*	*ORW or SRW*	*Zone II or IWPA*	*Description*
Wetland ST-10 (100 Series)	No	No	No	No	PFO
Wetland ST-149.3	No	No	No	No	PFO
Wetland EA1 (100 Series)	No	No	No	No	PFO

Notes: Wetland Classifications: PEM = Palustrine Emergent, PFO = Palustrine Forested

According to the National Resources Conservation Service (NRCS), surface soils on the Site include Merrimac Fine Sandy Loam, Hinckley Sandy Loam, Woodbridge Fine Sandy Loam, Paxton Fine Sandy Loam, Scarboro and Birdsall, and Whitman Fine Sandy Loam. On-site soils are classified as Hydrologic Soil Groups (HSG) A, A, C, C, C, D, and D respectively.

The project is not located within the 100-year flood plain as shown on the FEMA Floodway Map, Town of Stoughton, Massachusetts Norfolk County, Community Panel Number 2502530004B, dated June 1, 1982 and the FEMA Floodway Map, Bristol County, Massachusetts (All Jurisdictions), Map Number 25005C0053F, dated July 7, 2009 included in Appendix B.

Existing Drainage Conditions

Under existing conditions, the Site is a vacant wooded area with a small paved area that is used to store construction equipment and material. For the existing conditions hydrologic analysis, the site was divided into four drainage areas that contribute to three design points. Additional there is an existing wetland onsite that acts as a detention pond for a portion of the site. The following is a summary of each drainage area.

Drainage Area 1 – This 1.55-acre area in the northern portion of the site consists mainly of an undeveloped wooded area. There is also a small area comprised of dirt cover. Runoff from this area flows in a northerly direction to Wetland ST-10 (100 Series) (Design Point 1). When the wetland overflows, runoff flows through a culvert under the tracks to the west.

Drainage Area 2 – This 7.28-acre area in the center of the site consists mainly of paved area used to store construction equipment and materials. There are small wooded areas located among the pavement. Runoff from this area flows untreated in a westerly direction to Wetland ST-149.3 located on the western side of the site, between the site and the existing train tracks. This wetland acts as an existing pond that when overflows travel overland to the south into Wetland EA1 (100 Series) (Design Point 3).

Drainage Area 3 – This 3.19-acre area in the southern portion of the site consists mainly of open space and woods. There are also small areas of gravel access drives

and utility infrastructure. The existing detention basin, which takes runoff from the retail/office development, is not included in this analysis. Runoff from the basin is directed to the Wetland. Runoff from this area flows directly into Wetland EA1 (100 Series) (Design Point 3).

Drainage Area 4 – This 0.65-acre area in the southern portion of the site consists mainly of open space and woods. Runoff from this area flows directly into Wetland EA1 (100 Series) (Design Point 4).

Figure 3 illustrates the existing drainage patterns on the Site. Table 2 below provides a summary of the existing conditions hydrologic data.

Table 2:
Existing Conditions Hydrologic Data

Drainage Area	*Discharge Location*	*Design Point*	*Area (acres)*	*Curve Number*	*Time of Concentration (min)*
1	Wetland ST-10 (100 Series)	1	1.55	67	8.5
2	Wetland ST-149.3	3	7.28	75	9.2
3	Wetland EA1 (100 Series)	3	3.19	62	14.8
4	Wetland EA1 (100 Series)	4	0.65	81	5.0

Proposed Drainage Conditions

Figure 4 illustrates the proposed "post construction" drainage conditions for the project. As shown, the Site will be divided into nine (9) drainage areas that discharge treated stormwater to the three existing Design Points. Existing drainage and grading patterns were maintained to the maximum extent possible. Stormwater management techniques have been incorporated into the design. These BMPs are focused on decentralizing stormwater management and reduce peak runoff rates, maximize groundwater recharge and treat for water quality. The following is a summary of each drainage area.

Drainage Area 1 – This 1.34-acre area in the northern portion of the site consists of an undeveloped wooded area. It will generally remain in its existing condition. Runoff from this area flows directly to Wetland ST-10 (Design Point 1).

Drainage Area 2 – This 1.42-acre area in the northern portion of the site consists of a portion of the paved parking area for the station, some undeveloped wooded area, and Bioretention Basin 1 to the north of the parking. Runoff from this area sheet flows across the parking area and is then carried via a grassed channel to Bioretention Basin 1, which discharges to Wetland ST-10 (Design Point 1).

Drainage Area 3 – This 2.10-acre area in the central portion of the site consists of the eastern portion of the paved parking area for the station, some undeveloped wooded area, and some ancillary landscape areas. Runoff from the parking area will sheet flow into deep sump hooded catch basins and travel through the closed drainage system passing through a oil/grit separator prior to discharging to a sediment forebay, and terminating in Infiltration Basin 2. Basin 2 discharges to Wetland EA1 (Design Point 3).

Drainage Area 4 - This 0.13-acre area in the central portion of the site consists of paved access drive for the station parking, some ancillary landscape areas and Infiltration Basin 2. Runoff from the access drive will flow into a deep sump hooded catch basin and travel through the closed drainage system passing through a oil/grit separator prior to discharging to a sediment forebay, and terminating in Infiltration Basin 2, which discharges to the rail swale to Wetland EA1 (Design Point 3).

Drainage Area 5 – This 0.30-acre area in the southeastern portion of the site consists of a paved access drive for the station parking and some ancillary landscape area. Runoff from this area sheet flows to a deep sump hooded catch basin and travels through the closed drainage system prior to discharging to a sediment forebay and terminating in Infiltration Basin 3, which discharges through a closed drainage system to Wetland EA1 (Design Point 3).

Drainage Area 6 - This 1.26-acre area in the south portion of the site consists of a paved exit drive for the station parking, some ancillary landscape area, and Infiltration Basin 4. Runoff from this area flows to a deep sump hooded catch basin and travels through the closed drainage system prior to discharging to a sediment forebay and terminating in Infiltration Basin 4, which discharges to the rail swale to Wetland EA1 (Design Point 3).

Drainage Area 7 - This 2.80-acre area in the central portion of the site consists of the western portion of the paved parking area for the station, some undeveloped wooded area, and some ancillary landscape areas. Wetland 149.3 will be filled and replicated at an offsite location. Runoff from the parking area will sheet flow into deep sump hooded catch basins and travel through the closed drainage system passing through a oil/grit separator prior to discharging to a sediment forebay, and terminating in Infiltration Basin 5, which discharges directly to Wetland EA1 (Design Point 3).

Drainage Area 8 – This 0.55-acre area in the southern portion of the site consists of landscape area and some undeveloped wooded areas. Runoff from this area flows directly to Wetland EA1 (Design Point 4).

Drainage Area 9 – This 1.49-acre area in the southern portion of the site consists of landscape area, existing leaching basin, and Infiltration Basin 5. Runoff from this area flows directly to Infiltration Basin 5, which discharges directly to Wetland EA1 (Design Point 3).

Table 3 below provides a summary of the proposed conditions hydrologic data.

Table 3:
Proposed Conditions Hydrologic Data

Drainage Area	*Discharge Location*	*Design Point*	*Area (acres)*	*Curve Number*	*Time of Concentration (min)*
1	Wetland ST-10	1	1.34	70	14.6
2	Wetland ST-10	1	1.42	75	15.0
3A	Wetland EA1	3	1.50	78	16.8
3B	Wetland EA1	3	0.60	98	5.0
4	Wetland EA1	3	0.13	82	5.0
5	Wetland EA1	3	0.30	92	5.0
6	Wetland EA1	3	1.26	77	5.0
7	Wetland EA1	3	2.80	95	5.0
8	Wetland EA1	4	0.55	81	6.7
9	Wetland EA1	3	1.49	68	7.3

Integrated into the site design is a comprehensive stormwater management system that has been developed in accordance with the Massachusetts Stormwater Handbook. Because the Project is located within an area of rapid infiltration and is considered a LUHPPL, the proposed stormwater management system has been designed to treat the one inch Water Quality Volume and provide 44% Total Suspended Solids (TSS) pretreatment prior to infiltration.

Environmentally Sensitive and Low Impact Development (LID) Techniques

Low Impact Development (LID) techniques and stormwater Best Management Practices (BMPs) implemented into the site design include:

- Infiltration basins
- Bioretention basin
- Minimal disturbance to existing trees and vegetation
- Grassed swales
- Oil/grit separator
- Light colored pavement sidewalks

In general stormwater runoff from the northern portion of the site sheet flows off of the impervious surface and is conveyed via a grassed swale to a Bioretention basin. Stormwater runoff from the southern portion of the site is collected in deep sump hooded catch basins and travels through the closed drainage system and passes through an oil/ grit separator prior to discharging to the sediment forebays, and terminating at the infiltration basins. Wooded areas in the northern portion of the property are to be maintained in their existing conditions as much as possible.

Hydraulic Analysis

The closed drainage system was designed for the 25-year storm event, in accordance with the Massachusetts Bay Transportation Authority, Railroad Operations, Commuter Rail Design Standards Manual, Volume 1.

Drainage pipes were sized using Manning's Equation for full-flow capacity and the Rational Method. Pipe sizing calculations are included in Appendix A of this Stormwater Report.

Regulatory Compliance

Massachusetts Department of Environmental Protection (DEP) - Stormwater Management Standards

As demonstrated below, the proposed Project fully complies with the DEP Stormwater Management Standards at 310 CMR 10.05.

Standard 1: No New Untreated Discharges or Erosion to Wetlands

The Project has been designed to fully comply with Standard 1.

The Best Management Practices (BMPs) included in the proposed stormwater management system have been designed in accordance with the Massachusetts Stormwater Handbook. Supporting information and computations demonstrating that no new untreated discharges will result from the Project are presented through compliance with Standards 4 through 6.

All proposed Project stormwater outlets and conveyances have been designed to not cause erosion or scour to wetlands or receiving waters. Outlets from closed drainage systems have been designed with flared end sections and stone protection to dissipate discharge velocities. Overflows from BMP's that impound stormwater have been designed with stone to protect down gradient areas from erosion.

Computations and supporting information for the sizing and selection of materials used to protect from scour and erosion are included in Appendix A.

Standard 2: Peak Rate Attenuation

The Project has been designed to fully comply with Standard 2.

The rainfall-runoff response of the Site under existing and proposed conditions was analyzed for storm events with recurrence intervals of 2, 10, and 100-years. The results of the analysis, as summarized in Table 4 below, indicate that there is no increase in peak discharge rates between the existing and proposed conditions.

Computations and supporting information regarding the hydrologic modeling are included in Appendix B.

Table 4:
Peak Discharge Rates (cfs*)

Design Point	*2-year*	*10-year*	*100-year*
Design Point 1: Wetland ST-10			
Existing	1.14	2.60	5.48
Proposed	1.03	2.16	4.34
Design Point 3: Wetland EA1			
Existing	1.17	3.28	8.97
Proposed	0.76	2.77	7.78
Design Point 4: Wetland EA1			
Existing	1.28	2.18	3.75
Proposed	1.03	1.76	3.01

* cubic feet per second

Standard 3: Stormwater Recharge

The Project has been designed to fully comply with Standard 3.

In accordance with the Stormwater Handbook, the Required Recharge Volume for the Project is 6,926 cubic feet.

Recharge of stormwater has been provided through the use of infiltration basins which have been sized using the static method. Each infiltration BMP has been designed to drain completely within 72 hours. Table 5 below provides a summary of the proposed infiltration BMPs utilized for the Project.

Table 5
Summary of Recharge Calculations

Infiltration BMP	*Provided Recharge Volume (cubic feet)*
Bioretention Basin 1	7,829
Infiltration Basin 3	947
Infiltration Basin 4	5,356
Infiltration Basin 5	10,896
Total Provided Recharge	25,028
Total Required Recharge	6,926

A Geotechnical Report that describes subsurface soil conditions is included as an appendix to this report.

Standard 4: Water Quality

The Project has been designed to fully comply with Standard 4.

The proposed stormwater management system implements a treatment train of BMPs that has been designed to provide a minimum of 80% TSS removal for stormwater runoff from all proposed impervious surfaces as well as 44% pretreatment prior to infiltration BMPs.

Computations and supporting information are included in Appendix D.

Standard 5: Land Uses with Higher Potential Pollutant Loads (LUHPPLs)

The site is considered a LUHPPL as defined in 3.10 CMR 10.04 and 314 CMR 9.02 because it is a parking lot with a high-intensity use (1,000 vehicle trips per day or more). Therefore has been designed with suitable BMPs sized to treat the 1-inch Water Quality Volume and provide the pretreatment requirement of 44% TSS removal prior to infiltration. Proposed source controls and pollution prevention measures will be identified in the Long-Term Pollution Prevention Plan.

For computations and supporting information regarding the sizing of BMPs suitable for treatment of runoff from LUHPPLs, see Appendix D.

Standard 6: Critical Areas

The Project will not discharge stormwater near or to a critical area.

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the Maximum Extent Practicable

The Project is a redevelopment, but has still been designed to fully comply with all ten of the Stormwater Management Standards.

Refer directly to each Standard for applicable computations and supporting information demonstrating compliance with each.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Controls

The Project would disturb approximately 9.0 acres of land and is therefore required to obtain coverage under the Environmental Protection Agency (EPA) National Pollutant Discharge Elimination System (NPDES) Construction General Permit (CGP). As required under this permit, a Stormwater Pollution Prevention Plan (SWPPP) would be developed and a Notice of Intent for the CGP would be submitted by the contractor and owner at least 14 days before land disturbance begins. Recommended construction period pollution prevention and erosion and sedimentation controls were discussed in the DEIR/S. Appropriate controls will be prepared and implemented by the contractor and MassDOT (MBTA) during construction in accordance with the final design and NPDES SWPPP.

Standard 9: Operation and Maintenance Plan

In compliance with Standard 9, a Post Construction Stormwater Operation and Maintenance (O&M) Plan will be developed by the MBTA during final design for the Project.

Standard 10: Prohibition of Illicit Discharges

The site was previously undeveloped and no sanitary sewer or storm drainage infrastructure is known to exist on the site. The design plans submitted with this report have been designed in full compliance with current standards. The Long-Term Pollution Prevention Plan will include measures to prevent illicit discharges.

Appendix B
Standard 2 Computations and Supporting Information

Rainfall volumes used for this analysis were based on the Natural Resources Conservation Service (NRCS) Type III, 24-hour storm event for Norfolk County. Runoff coefficients for the existing and proposed conditions, as previously shown in Tables 1 and 2 respectively, were determined using NRCS Technical Release 55 (TR-55) methodology as provided in HydroCAD. The HydroCAD model is based on the NRCS Technical Release 20 (TR-20) Model for Project Formulation Hydrology.

Soil Evaluation and Analysis

United States Department of Agriculture

Natural Resources Conservation Service

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for Bristol County, Massachusetts, Northern Part; and Norfolk and Suffolk Counties, Massachusetts

March 27, 2012

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://soils.usda.gov/sqi/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (http://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://soils.usda.gov/contact/state_offices/).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Soil Data Mart Web site or the NRCS Web Soil Survey. The Soil Data Mart is the data storage site for the official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means

for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

Soil Information for All Uses

Soil Properties and Qualities

The Soil Properties and Qualities section includes various soil properties and qualities displayed as thematic maps with a summary table for the soil map units in the selected area of interest. A single value or rating for each map unit is generated by aggregating the interpretive ratings of individual map unit components. This aggregation process is defined for each property or quality.

Soil Qualities and Features

Soil qualities are behavior and performance attributes that are not directly measured, but are inferred from observations of dynamic conditions and from soil properties. Example soil qualities include natural drainage, and frost action. Soil features are attributes that are not directly part of the soil. Example soil features include slope and depth to restrictive layer. These features can greatly impact the use and management of the soil.

Hydrologic Soil Group

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

MAP INFORMATION

Map Scale: 1:4,990 if printed on A size (8.5" × 11") sheet.

The soil surveys that comprise your AOI were mapped at scales ranging from 1:20,000 to 1:25,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for accurate map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: UTM Zone 19N NAD83

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Bristol County, Massachusetts, Northern Part
Survey Area Data: Version 5, Jul 27, 2010

Soil Survey Area: Norfolk and Suffolk Counties, Massachusetts
Survey Area Data: Version 8, Jul 23, 2010

Your area of interest (AOI) includes more than one soil survey area. These survey areas may have been mapped at different scales, with a different land use in mind, at different times, or at different levels of detail. This may result in map unit symbols, soil properties, and interpretations that do not completely agree across soil survey area boundaries.

Date(s) aerial images were photographed: 7/10/2003

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Table—Hydrologic Soil Group

Hydrologic Soil Group— Summary by Map Unit — Bristol County, Massachusetts, Northern Part (MA602)				
Map unit symbol	**Map unit name**	**Rating**	**Acres in AOI**	**Percent of AOI**

Design Memorandum

Date	January 23, 2012
To	Rick Carey, Natasha Velickovic - VHB
From	Paul Murphy, Da Ha, Peter Chou - Jacobs
Cc	
Subject	MBTA South Coast Rail (New Bedford/Fall River Commuter Rail Extension) North Easton Station Geotechnical Design Memorandum Easton, MA
Project No.	E2347101

INTRODUCTION

The South Coast Rail project will restore passenger rail transportation from South Station in Boston to the cities of Fall River and New Bedford along an existing rail freight corridor running south from Taunton to Fall River and New Bedford. The project will include the construction of several existing and new passenger stations and two terminal layover facilities. This geotechnical design memorandum presents the foundation design considerations for the new station platform at the proposed North Easton Station in Easton, Massachusetts. The design recommendations presented in this report are based on the results of subsurface investigation performed by Jacobs in 2010.

Existing Conditions

The proposed North Easton Station is off Route 138 in Easton, behind the Roche Brothers Shopping Plaza (Figure 1). The station site is undeveloped and entirely vegetated, but has evidence of earthwork, most likely as a result of the construction of the shopping plaza. In addition to the shopping plaza to the east, the site is adjacent to forested land to the west and south. The shopping plaza contains six buildings in good condition as all are relatively new. A medical office building adjacent to the proposed station site is the newest building. Existing grades at the platform location range from elevations 160 to 154 feet (NGVD29 Datum), generally sloping downward from north to south.

Proposed Construction

A commuter parking lot, drop-off ramps and platform are currently proposed at this site. Current station plans are to construct a new parking area and a new drop-off area, and add an 800 foot long, 12 foot wide high level center platform adjacent to the existing tracks with some track relocation required, as well as the addition of a second track. Access to the platform will be from a new ramp/stair structure along the east side of the tracks with a bridge over the track to the platform. Approximately 375 feet of the platform will be under a new station canopy. The details of new track layout (including grading), associated sidewalks and ramps of the proposed station are still under development at the time of this report preparation. This report focuses on the foundations for the platform only.

SCOPE OF WORK

This memorandum was prepared by Jacobs Engineering Group (Jacobs) in accordance with the scope of work under the contract between Jacobs and VHB for work on the New Bedford/Fall River Commuter Rail Line Extension Project for Massachusetts Bay Transportation Authority (MBTA). The geotechnical work included the following tasks:

- Perform a geotechnical exploration and laboratory testing program;
- Report and interpret the results of the exploration and laboratory testing program; and
- Provide geotechnical recommendations for design and construction of the platform foundations.

The Jacobs scope of work did not include environmental analyses to assess the potential presence of any hazardous materials at the project site or potential impacts to adjacent structures during construction.

LOCAL GEOLOGY

The soils at the site are underlain by the Dedham Granite. The Dedham Granite is Proterozoic in age, medium grained, and light gray, pinkish gray and greenish gray in color. The intact strength of the rock averages about 35,000 psi. The rock mass is sparsely fractured. The top of rock was encountered as shallow as five feet in some of the borings but extended deeper than 16 feet in others. The top of rock was typically sharp, with little or no residual soil. In some borings, there appeared to be a layer of granite, followed by a zone of soil, followed by granite. The intervening layer of soil was typically not sampled and described simply as material not recovered by rock coring. The most likely explanation is that exfoliation has caused large slabs of rock to pop off the top of the main body of rock. If this explanation is correct, then these slabs could extend laterally for tens of feet and could have open voids beneath them. Another possible explanation is that these layers are localized boulders in the glacial deposits overlying the rock. The similarity between the upper layer the underlying rock suggests that the first explanation is more likely. Heavily loaded foundations will need to pass through the upper slab and into the underlying, competent rock.

GEOTECHNICAL EXPLORATIONS

Jacobs Engineering Group planned the subsurface exploration program and retained the drilling contractor to perform the explorations. The geotechnical data reports were submitted in 2010. Five borings (NES-1, NES-2, NES-2A, NES-3 and NES-4) were conducted along the proposed station platform and eighteen borings (NES-6 to NES-9, NES-11, NES-11A, NES-12 to NES-17, NES-19, NES-19A and NES-20 to NES-23) were drilled in the general vicinity of the proposed parking lot and its driveways for the 2010 explorations. Boring locations are shown on the Subsurface Exploration Plan (Figure 2).

The 2010 borings were drilled by New Hampshire Boring of Brockton, Massachusetts using either a CME-550 or D-50 ATV mounted drill rig, a D-90 or D-120 track mounted drill rig, or a CME-75 truck mounted drill rig. The borings were advanced through the soil by wash boring methods using a 4-inch casing and roller bit with water. Standard penetration tests (SPT), consisting of a 140-pound hammer dropping 30 inches on a standard 2-inch-diameter (OD) split-spoon sampler, were performed with a safety hammer or automatic hammer to establish the consistency of the subsurface soils. The SPT's were typically performed at five foot intervals of depth. The obtained samples were sealed in glass jars to retain their natural moisture. Bedrock was not encountered during the explorations.

The borings were observed by a representative from Jacobs. The soil samples were classified in the field in accordance with ASTM D-2488, Standard Practice for Description and Identification of Soils (Visual-Manual

Procedure) by Jacobs' representative, and appropriate stratum breaks were interpolated from drilling and sampling observations. The boring logs were prepared by Jacobs based on the field classifications and laboratory testing, and are presented in Appendix A.

LABORATORY TESTING

The results of the laboratory testing were previously submitted to VHB in a report entitled "South Coast Rail, Jacobs Geotechnical Data Report", dated November 2010.

Grain size distribution analyses were performed to evaluate the gradation of the natural granular soils for potential reuse as backfill, if needed, and to confirm sample classifications. The analyses are summarized in Table 1 below and are presented in Appendix B.

Table 1: Laboratory Soil Classification Summary

BORING NO.	SAMPLE NO.	ELEVATION (FEET)	USCS SOIL CLASSIFICATION	W (%)	GRAVEL (%)	SAND (%)	FINES (%)
NES-4	S4	144.0	Silty Clay (CL)	23.6	0.0	1.9	98.1
NES-5	S2	154.0	Silty Sand (SM)	1.1	13.3	68.3	18.4
NES-14	S2	162.0	Silty Sand w/ Gavel (SM)	NT	32.7	51.3	16.0
NES-21	S2	158.0	Gravel w/ Silt + Sand (GW-GM)	NT	56.9	34.1	9.0

Where: w = natural moisture content, NT = Not Tested.

SUBSURFACE CONDITIONS

The subsurface conditions at the site were inferred from the boring data collected for the South Coast Rail project, with some interpretations. The subsurface conditions encountered at the station platform area during our 2010 explorations generally consist of a layer of granular fill with thickness of about 4 to 9 feet, underlain by a sand and gravel layer with thickness ranging from 0 to 26 feet overlying bedrock. A 10 feet thick hard silty clay layer was encountered within the sand and gravel layer from about 14 to 24 feet below ground surface in boring NES-4. Boulders were encountered at borings NES-2, NES-3 and NES-5 within the upper 5 to 10 feet of the borings. Bedrock was encountered at a depth of about 5 to 35 feet in the platform area, corresponding to approximately elevations 123 to 151.5 feet.

Fill materials with thicknesses varying from 0 to 8 feet were also encountered in the vicinity of the proposed parking lot area. Bedrock was encountered at a depth about 4 to 18 feet (corresponding to elevations 133 to 169.5 feet) with generally shallower bedrock found on the south side of the parking lot and in the area of the proposed infiltration basin.

Subsurface soil conditions are summarized in Table 2 below.

Table 2: Summary of Subsurface Conditions at Available Borings

BORING NUMBER	GROUND SURFACE ELEV. (FT)	APPROX. FILL THICKNESS (FT)	TOP OF NATURAL SOIL ELEV. (FT)	APPROX. TOP OF ROCK ELEV. (FT)	BOTTOM OF BORING ELEV. (FT)	APPROX. GROUND WATER ELEV. (FT)	REMARKS

NE: Not encountered at the boring during drilling. NR: Not recorded.

Fill: The fill layer typically consists of mostly granular, loose to very dense sand with up to about 15% silt and 15% gravel. The fill layer is generally about 0 to 4 feet thick but may be as thick as 9 feet in the area of the platform.

Natural Granular Deposits: In the platform area, the natural soil deposits below the fill generally consist of predominantly sand with up to about 30% gravel and 20% silt. These deposits are loose to very dense with Standard Penetration Test (SPT) N-values ranging between 9 and in excess of 50 blows per foot (bpf). The numerous high N-values encountered may be caused by the presence of large pieces of gravel and cobbles or even boulders, which are common within this type of deposit.

An approximately 10 feet thick hard silty clay layer was encountered in boring NES-4 from about 14 to 24 feet below ground surface, corresponding to elevations 134 to 144 feet.

Bedrock: Granite bedrock was encountered in the platform area at depth of about 5 to 35 feet below existing ground surface, corresponding to approximately elevations 123 to 151.5 feet. The bedrock was generally hard, fresh to slightly weathered GRANITE.

Bedrock was encountered at elevations ranging from about 133 to 169.5 feet in other site areas. In the vicinity of borings NES-11 and NES-15, bedrock was encountered above the proposed grades at the site.

Groundwater: Groundwater levels were measured in the test borings using a weighted tape during and at completion of drilling. The data indicated the groundwater level ranged from approximate elevations 140.5 to 154.0 feet in the general area of the platform, and from elevations 135.5 to 172 feet in the general site area. The use of wash boring techniques for all soil borings may have artificially increased the water level readings due to the addition of water to the borings. Trapped/perched water is also commonly seen at a higher elevation within existing fill or silty materials. The longer term water level readings taken at Boring NES–1 OW on July 9, 2010 indicated the ground water level at a depth of about 17.0 feet (Elevation 134.0 feet). The longer term water level readings taken at Boring NES–5 OW on July 9, 2010 and September 12, 2011 indicated the water at a depth of about 17.5 feet (Elevation 140.5 feet) and 15.5 feet (Elevation 142.5 feet), respectively.

Groundwater levels should be expected to fluctuate with rainfall and other seasonal variations. Local and periodic variations of ground water elevations may also be influenced by local subsurface drainage and, leaking water or sewer pipes. More long-term observations would be required to evaluate true groundwater levels and their influence on planned construction. However, based upon these short-term observations and readings from the observation well at Boring NES–1 OW and NES-5 OW, it is anticipated that the groundwater could be at within 15 to 18 feet below existing grade at both the platform and the parking lot areas.

GEOTECHNICAL RECOMMENDATIONS

Based on our review of available subsurface information, the proposed station platforms can be supported on spread footings bearing directly within either competent natural soil or structural fill placed above suitable natural soils. Final platform and canopy design loads were not available at the time of this report preparation. However, it is anticipated that the station platform will be lightly (axially) loaded with limited horizontal forces from wind and seismic loads.

The following paragraphs provide project specific geotechnical recommendations for foundation soil preparation, structural fill/backfill placement, and design and construction of spread footings.

Platform Foundation- Spread Footings

Spread footings are recommended for the platform foundations, bearing on compacted structure fill or natural granular deposits. The bottom of footing elevation should be at least 4 feet below final grades for frost protection. The existing fill is not suitable for support of the spread footings and should be removed within the zone of influence of the footing, defined by a line extending one foot horizontally from the bottom edge of footing and then down and away at a 1H:1V slope until natural granular soils are encountered.

The recommended allowable design bearing capacity for spread footings bearing on structural fill or natural sand and gravel deposits is 5 ksf, provided that subgrades are prepared as described herein. This provides an adequate factor of safety against bearing failure and limits the total estimated settlement to less than one inch and the differential settlement to less than ½ inch. All footings should be at least 4 feet wide.

The structural fill material, if needed, should be free from organics and other deleterious substances and should conform to the requirements listed in the MBTA Standard Specification Section 02200 - Earthwork for Type B Gravel Borrow. The structural fill should be compacted to 95% of the maximum dry density as determined by the Modified Proctor compaction test (ASTM D1557).

All temporary open cuts required for footing construction should be in accordance with the related OSHA regulations and should have side slopes of no steeper than 1.5H:1V.

Seismic Consideration

The seismic design should comply with the requirements of the most current Massachusetts State Building Code 780 CMR and other relevant project design codes such as AREMA and AASHTO. Modification of the peak acceleration by the soils overlying bedrock depends upon the type of soil at the site. For the subsurface conditions encountered, the station site is classified as Seismic Site Class C soil profile in accordance with 780 CMR Chapter 1614.0 Section 9.4 Site Ground Motion. The structure could be designed for the total lateral seismic force using the equations specified in the code, or by the response spectrum method using the design spectra presented in the code. The maximum considered earthquake ground motions shall be as represented by the spectral response acceleration at short periods (Ss) and at 1-sec (S_1) obtained from Table 1604.10 of the Massachusetts State Building Code and adjusted for Site Class effects using the site coefficients of Section 9.4.1.2.4.

For Site Class C Soils at the location of this station:

$S_{MS} = 0.300$ and $S_{M1} = 0.109$

$S_{DS} = 0.200$ and $S_{D1} = 0.073$

where:

- S_{MS} is the maximum consider earthquake spectral response acceleration for short periods adjusted for site class
- S_{M1} is the maximum consider earthquake spectral response acceleration at 1-sec adjusted for site class
- S_{DS} is the design earthquake spectral response acceleration for short periods adjusted for site class

- S_{D1} is the design earthquake spectral response acceleration at 1-sec adjusted for site class

The building code also requires that the soil be evaluated for the following potential hazards: slope instability, soil liquefaction, or surface rupture due to faulting or lateral spreading. The proposed grading is relatively flat and we are not aware of any pre-existing slope instability in this area. The existing overburden soils do not appear to be subject to surface rupture due to faulting or lateral spreading.

Liquefaction

Based on the observed subsurface conditions, recorded water levels, percentage of fine contents and sample relative densities (high SPT N-values), the existing soils underlying the site are judged not susceptible to liquefaction.

CONSTRUCTION CONSIDERATIONS

Foundation Installation - Spread Footings

Following excavation to the base of the spread footing subgrade or to the bottom of existing fill layer, whichever is deeper, the exposed surface should be observed by an on-site representative of the project geotechnical engineer and proof-compacted with at least 10 passes of a large vibratory drum roller. Any yielding areas should be observed by geotechnical personnel to assess if additional localized undercutting is necessary. Footing inspections should include hand auger probes by the geotechnical personnel to identify soft/weak zones. The need for undercutting and backfilling with structural fill should be closely evaluated in the field based on encountered conditions.

If bedrock is encountered at the proposed bottom of footing elevation, the footing should either bear entirely on bedrock or entirely on soil. Where partial bedrock subgrade is encountered at the bottom of footing elevation, the bedrock should be over-excavated to a depth of at least 10 inches below the bottom of footing elevation and replaced with compacted Gravel Borrow to provide a uniform bearing surface.

In areas where seepage is encountered within footing excavations, the need for placing a 3" thick lean concrete mud mat or a layer of ¾-inch crushed stone to protect the bearing surface should be evaluated in the field. Crushed stone thicker than 4 inches shall be wrapped by non-woven filter fabric.

Following observation of the bearing soils by geotechnical personnel, reinforcing steel and concrete can be placed in the excavation. It is recommended that footing reinforcing steel and concrete be placed the same day as the footing excavation is made, where possible, to avoid significant moisture content changes in the bearing soils. No water should be allowed to pond within excavations and drainage should be maintained away from foundations both during and after construction. The footing excavation should be free of loose debris at the time of footing concrete placement.

Subgrade Preparation

Prior to performing any required grading operations and excavations in the proposed structure footprints, walkway and paved areas, these areas should be stripped of topsoil, vegetation, and existing pavement, if present. The topsoil should be placed in a designated area for reuse during final grading. Following site clearing and stripping, the exposed subgrade should be proof compacted with 10 passes of a large vibratory

drum roller. Any pockets of excessively soft, wet or disturbed soil or unsuitable soils should be removed and replaced with properly compacted fill materials.

If additional rolling does not correct the unstable condition, the subgrade should be scarified to a depth of at least six inches but not exceeding eighteen inches, aerated, re-compacted, and retested to provide uniform compaction. Following satisfactory compaction of the subgrade, controlled compacted fill material should be placed to bring the site to the required grade.

Fill should not be placed over frozen soil. Soil subgrades should be protected against frost both during and after construction.

Proper drainage of construction areas should be provided to protect the subgrades from the detrimental effects of weather conditions. Excavations should be made with as few passes of the backhoe bucket as possible to reduce disturbance of the subgrade. Also if possible, a backhoe bucket fitted with a smooth blade should be used during the final subgrade preparation, where necessary. The exposed base should be kept free of standing water at all times. The site should be graded to carry any surface runoff away from the work areas. Construction traffic should be controlled to prevent excessive stresses and disturbance to the subgrade.

If pavements are not constructed immediately after grading, the subgrade should be shaped so as to prevent ponding. If there is a substantial lapse in time between grading and paving, or if the subgrade is disturbed, it should be proof-rolled with a loaded, tandem-wheeled dump truck. Soft spots observed during proof-rolling or initial construction should be removed and replaced with compacted granular fill.

Within the proposed paved areas, and extending a distance of five feet beyond the edge on all sides, excavate existing granular fill soils to a depth of two feet below existing site grades. It may be possible to reuse the existing granular fill, depending on the suitability of the material, as described herein.

Fill Placement and Compaction

Fill materials most likely will be obtained by importing granular fill materials from off-site borrow sources. However, it may be possible to reuse existing site granular fill material provided that it can be properly placed and compacted. The gradation shall be in accordance with MBTA Standard Specification Section 02200-Earthwork for Type B Gravel Borrow.

All structural fill should be free of organics, demolition debris or other deleterious substances. The fill material should have a plasticity index (PI) less than 4 and a liquid limit (LL) less than 10, and contain fragments less than 4 inches in maximum dimension. Each lift should be compacted to the specified density prior to placing any subsequent lift. All materials to be used as structural fill should be tested in the laboratory to determine their project suitability and compaction characteristics.

The fill should be systematically compacted to the following percentages of the maximum dry density:

Table 3: Fill Compaction Requirements

DESCRIPTION	MINIMUM PERCENT COMPACTION (ASTM D-1557)
General Site Fills, Structural Fill (Below Footings and Slabs)	95
Behind Retaining Walls	92
Landscape Area	90

Soils which exhibit a well-defined moisture content–dry density relationship should be compacted to within plus or minus two percentage points of the optimum moisture content as determined by the Modified Proctor test (ASTM D-1557).

Where fill materials are placed against an existing embankment slope, the slope should be benched as the fill is brought up in layers. Benching should be of a sufficient width to permit placing and compaction of fill material upon the existing embankment materials. Typically, benches are between four to eight feet wide. Each bench cut should begin at the intersection of the existing embankment and the vertical side of the previous bench. Trench backfills over pipelines or utility structures should be performed so as not to adversely impact the underlying utilities. In fill areas, the backfill material, compaction method, and degree of compaction requirements should be similar to that for the fill adjacent to the trench.

Construction Dewatering

All excavations should be performed in the dry condition. Discharge of pumped water should be performed in accordance with all federal, state and/or local regulations which may require a discharge permit and possible filtration and chemical testing of the water prior to discharge.

Permanent Slopes

Permanent slopes with loamed and seeded surfaces should not be steeper than 2-1/2 horizontal to 1 vertical (2-1/2H:1V) without slope protection to limit erosion and surficial sloughing of the slope. Additional analyses may be required to assess the stability of slopes steeper than 2-1/2H:1V as the station design is finalized.

Excavation Slopes and Shoring

The slopes of open cuts should be no steeper than 1-1/2H:1V. Open cuts should not be used below the water table because of the likelihood of soil sloughing into the excavation.

The temporary excavation support system, if needed, should be selected by the Contractor and designed by an experienced registered Professional Engineer in the Commonwealth of Massachusetts and retained by the Contractor. Where excavation sides can be sloped back, they should be performed in accordance with the Occupational Safety and Health Administration (OSHA) Construction Industry Standards.

Protection of Existing Facilities

It is recommended that a geotechnical instrumentation and monitoring program be performed during construction of the project to evaluate impacts on adjacent structures. It is recommended that the program be developed to provide data for the following considerations:

- To monitor ground movements and vibration levels during construction.
- To provide early warning of potentially adverse trends by presenting sufficient data to determine the source of unanticipated ground movements, if present.
- If necessary, to plan remedial measures to limit damage to embankments and structures and to provide early warning when alternative means of protection are necessary.
- To document impacts of construction on adjacent facilities.
- To evaluate the performance and structural integrity of the constructed facilities.

We recommend the following instrumentation program to measure:

- Ground surface settlement and lateral movement adjacent to proposed construction.
- Horizontal and vertical movement of any excavation support system, and existing structures.
- Vibrations as a result of construction activities.

Vertical and horizontal survey points should be established on the adjacent structures. The monitoring points should be surveyed prior to the start of construction and monitored during construction to detect movement.

Vibration monitoring shall be conducted within 100 feet of existing structures during construction activities.

We recommend conducting a pre-construction survey of structures and utilities within 100 feet of the site to document existing conditions prior to construction. Documentation should include photographs, video, sketches, and/or written comments.

Specific instrumentation and monitoring requirements shall be based on the proposed construction sequence, duration of construction, and performance criteria. Initial measurements should be established well in advance of construction so that baseline data can be developed. This information will be invaluable for providing early warning of adverse trends and for assessing the need for mitigating measures.

CLOSING

This report and the recommendations contained herein have been prepared for the exclusive use of MBTA and VHB and their representatives for specific application to the design and construction of the proposed North Easton Station in Easton, Massachusetts.

This report was prepared in accordance with generally accepted soil and foundation engineering practices. No warranty, expressed or implied, is made. The analysis, design and recommendations submitted in this report are based in part upon the data obtained from subsurface explorations available at the time of this report. Subsurface stratification variations between borings are anticipated. The reported groundwater levels only represent the water levels at the time noted on the logs. The nature and extent of variations between these explorations may not become evident until construction. If significant variations then appear, or if there are changes in the nature, design or location of the proposed structure, it may be necessary to reevaluate the recommendations of this report.

NOTES:

1. BORING LOCATIONS WERE DETERMINED BY INSTRUMENT SURVEY CONDUCTED BY COLER AND COLANTONIO, INC. WHEN OBSTRUCTIONS ARE ENCOUNTERED THE MOVED BORINGS WERE APPROXIMATELY DETERMINED BY TAPE MEASUREMENT AND LINE OF SIGHT FROM EXISTING FEATURES AND SHOULD BE CONSIDERED ACCURATE TO THE DEGREE IMPLIED BY THE METHOD USED.
2. FOR BORING LOGS SEE GEOTECHNICAL REPORT DATED JANUARY 2012 APPENDIX A.
3. SURFACE DETAIL AND TOPOGRAPHY SHOWN HEREON IS FROM AN ON-THE-GROUND SURVEY PERFORMED BY COLER & COLANTONIO, INC., FROM APRIL 2010 TO SEPTEMBER 2010.
4. PRIMARY GEODETIC SURVEY CONTROL WAS ESTABLISHED FROM AN ON-THE-GROUND SURVEY BY COLER & COLANTONIO, INC. USING GLOBAL POSITIONING SYSTEM (GPS) SURVEY METHODS IN FEBRUARY 2010. THE GRID COORDINATES ARE BASED ON THE MASSACHUSETTS STATE PLANE COORDINATE SYSTEM (MAINLAND 2001 – NAD83).
5. CONTOURS AND ELEVATIONS SHOWN HEREON ARE BASED ON THE NATIONAL GEODETIC VERTICAL DATUM 1929 (NGVD29).

APPENDIX C: GEOTECHNICAL CALCULATIONS

- Allowable Bearing Capacity and Estimated Settlement
- Seismic Site Class Evaluation

JACOBS

343 Congress Street
Boston, MA 02210
617/242-9222

JOB	MBTA South Coast Rail		
SUBJECT	North Easton Station		
CALCULATED BY	DH	**DATE**	1/23/2012
CHECKED BY	PM	**DATE**	1/23/2012

PURPOSE: Evaluate bearing resistance for platform shallow foundations.

REFERENCE: AASHTO LRFD Bridge Design Specifications, 2010
AREMA Manual for Railway Engineering, 2011 Edition

ASSUMPTIONS:
- Platform footing is 4 ft wide by 10 ft long.
- Bearing surface is well graded sand (SW) or silty sand (SM) w/ gravel.
- Footing embedment is at least 4 feet below ground surface.
- Groundwater level is at 15 feet below surface.
- Footing eccentricity is assumed to be zero.
- Estimated soil properties (experience, geotech literature, Table 10.4.6.2.4-1):

	γ (pcf)	ϕ
Sand or silty sand:	120	33

BEARING CAPACITY FACTORS (Table 10.6.3.1.2a-1):

Med. Dense Sand or Silty Sand with gravel:	ϕ	N_c	N_q	N_γ
	33	38.6	26.1	35.2

CALCULATE EFFECTIVE FOOTING WIDTH (B'):

$e < B/4$ (Section 10.6.3.3)

where: B = footing width (ft) = 4
e = eccentricity (ft)

Assume no footing eccentricity, thus, e = 0

$B' = B-2e$ 4

NOMINAL BEARING RESISTANCE (q_n):

$q_n = cN_{cm} + \gamma D_f N_{qm} C_{wq} + 0.5\gamma B' N_{\gamma m} C_{w\gamma}$ (Eqn. 10.6.3.1.2a-1)

where:
- c = cohesion = 0
- γ = total unit weight = 120
- D_f = depth of footing (ft) = 4 Assumed
- B' = effective width of footing (ft) = 4
- L = length of footing (ft) = 10
- B'/L = 0.40
- D_f /B' = 1.00
- C_{wq} $C_{w\gamma}$ = groundwater correction factors (using B')
- C_{wq} = 1.0 (Table 10.6.3.1.2a-2)
- $C_{w\gamma}$ = 1.0 (Table 10.6.3.1.2a-2)

N_{cm} N_{qm} $N_{\gamma m}$ = bearing capacity factors

$N_{qm} = N_q s_q d_q i_q$ (Eqn. 10.6.3.1.2a-3)

s_q =	1.26	(Table 10.6.3.1.2a-3)
d_q =	1.20	(Table 10.6.3.1.2a-4)
i_q =	1.0	(see AASHTO p. 10-62)
N_{qm} =	39.5	

343 Congress Street
Boston, MA 02210
617/242-9222

JOB	MBTA South Coast Rail		
SUBJECT	North Easton Station		
CALCULATED BY	DH	**DATE**	1/23/2012
CHECKED BY	PM	**DATE**	1/23/2012

$N_{\gamma m} = N_\gamma s_\gamma i_\gamma$

s_γ = 0.84 (Table 10.6.3.1.2a-3)

i_γ = 1 (see AASHTO p. 10-62)

$N_{\gamma m}$ = 29.6

q_n = 26,035 psf

ALLOWABLE BEARING RESISTANCE (q_a):

$q_a = q_n/FOS$

where: FOS = factor of safety = 2.5 for sand

q_a = 10,414 psf

use

q_a =	**10.41**	**ksf**

strength limit value

Note: Based on the anticipated light loads and potentially small footing sizes, an allowable bearing capacity of 5 ksf is recommended.

Elastic Settlement Calculations:

$$S_e = \frac{(q_o\,(1-\nu^2)\sqrt{A'})}{144 E_s \beta_z}$$

eqn. 10.6.2.4.2-1

where: q_o = applied vert. stress (ksf)
ν = Poisson's Ratio
E_s = Young's Modulus (ksi)
β_z = Shape/Rigidity Factor

ν = Poisson's Ratio =	0.25	(Table C10.4.6.3-1)
E_s = Young's Modulus (ksi) =	5.00	(Table C10.4.6.3-1)
β_z = Shape/Rigidity Factor =	1.11	(Table 10.6.2.4.2-1)

where:

B' = eff. width of footing (ft) =	4	(from bearing resistance calcs)
L = length of footing (ft):	10	(from bearing resistance calcs)
A' =(B'xL) = footing area (ft^2):	40	ft^2

Settlement (S_e) for a given q_o:

q_o = applied vertical stress (ksf) = 5.00 ksf (assumed)

Se (inches) = 0.45 inches

North Easton Station Seismic Site Class Evaluation

Based on the platform boring with the deepest soil overburden (worst case)

	Total Depth =	100			
	Depth to Bedrock =	35			

Per 9.4.1.2.1*, N_{bar} > 50, Site Class C

9.4.1.2.1 Site Class Definitions. The site shall be classified as one of the following classes:

A = Hard rock with measured shear wave velocity, $\overline{v}_s$ > 5000ft/s (1500 m/s)

B = Rock with 2500 ft/s < $\overline{v}_s$ ≤5000 ft/s (760 m/s < $\overline{v}_s$ ≤ 1500 m/s)

C = Very dense soil and soft rock with 1200 ft/s ≤ $\overline{v}_s$ ≤ 2500 ft/s (370 m/s ≤ $\overline{v}_s$ ≤ 760 m/s) or $\overline{N}$ or $\overline{N}_{ch}$ > 50 or $\overline{s}_u$ ≥ 2000 psf (100 kPa)

D = Stiff soil with 600 ft/s ≤ $\overline{v}_s$ ≤ 1200 ft/s (180 m/s ≤ $\overline{v}_s$ ≤ 370 m/s) or with 15 ≤ $\overline{N}$ or $\overline{N}_{ch}$ ≤ 50 or 1000 psf ≤ $\overline{s}_u$ ≤ 2000 psf (50 kPa ≤ $\overline{s}_u$ ≤ 100 kPa)

E = A soil profile with $\overline{v}_s$ < 600 ft/s (180 m/s) or any profile with more than 10 ft (3 m) of soft clay. Soft clay is defined as soil with *PI* > 20, *w* ≥ 40%, and s_u < 500 psf (25 kPa)

F = Soils requiring site-specific evaluations:

1. Soils vulnerable to potential failure or collapse under seismic loading such as liquefiable soils, quick and highly sensitive clays, collapsible weakly cemented soils. Potential for liquefaction shall be evaluated in accordance with 780 CMR 1804.6: *Liquefaction*.

Exception. None.

2. Peats and/or highly organic clays (*H* > 10 ft [3 m] of peat and/or highly organic clay where *H* = thickness of soil).
3. Very high plasticity clays (H > 25 ft [7.6 m] with *PI* > 75).
4. Very thick soft/medium stiff clays (H>120 ft [37 m].

Exception. None.

Approx. Project Coordinates

Lat 42.088658
Long -71.098197

Seismic Coefficients

S_S = 0.25 (Table 1604.10*)
S_1 = 0.064 (Table 1604.10*)

For Site Class C

F_A = 1.2 (See Table 9.4.1.2.4a*)
F_V = 1.7 (See Table 9.4.1.2.4b*)

Design Spectral Response Parameters

S_{MS} = Ss x F_A = 0.300
S_{M1} = S_1 x F_V = 0.109

S_{DS} = 2/3 x S_{MS} = 0.200
S_{D1} = 2/3 x S_{M1} = 0.073

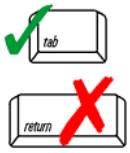
Checklist for Stormwater Report

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

A. Introduction

Important: When filling out forms on the computer, use only the tab key to move your cursor - do not use the return key.



A Stormwater Report must be submitted with the Notice of Intent permit application to document compliance with the Stormwater Management Standards. The following checklist is NOT a substitute for the Stormwater Report (which should provide more substantive and detailed information) but is offered here as a tool to help the applicant organize their Stormwater Management documentation for their Report and for the reviewer to assess this information in a consistent format. As noted in the Checklist, the Stormwater Report must contain the engineering computations and supporting information set forth in Volume 3 of the Massachusetts Stormwater Handbook. The Stormwater Report must be prepared and certified by a Registered Professional Engineer (RPE) licensed in the Commonwealth.

The Stormwater Report must include:

- The Stormwater Checklist completed and stamped by a Registered Professional Engineer (see page 2) that certifies that the Stormwater Report contains all required submittals.[1] This Checklist is to be used as the cover for the completed Stormwater Report.
- Applicant/Project Name
- Project Address
- Name of Firm and Registered Professional Engineer that prepared the Report
- Long-Term Pollution Prevention Plan required by Standards 4-6
- Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan required by Standard 8[2]
- Operation and Maintenance Plan required by Standard 9

In addition to all plans and supporting information, the Stormwater Report must include a brief narrative describing stormwater management practices, including environmentally sensitive site design and LID techniques, along with a diagram depicting runoff through the proposed BMP treatment train. Plans are required to show existing and proposed conditions, identify all wetland resource areas, NRCS soil types, critical areas, Land Uses with Higher Potential Pollutant Loads (LUHPPL), and any areas on the site where infiltration rate is greater than 2.4 inches per hour. The Plans shall identify the drainage areas for both existing and proposed conditions at a scale that enables verification of supporting calculations.

As noted in the Checklist, the Stormwater Management Report shall document compliance with each of the Stormwater Management Standards as provided in the Massachusetts Stormwater Handbook. The soils evaluation and calculations shall be done using the methodologies set forth in Volume 3 of the Massachusetts Stormwater Handbook.

To ensure that the Stormwater Report is complete, applicants are required to fill in the Stormwater Report Checklist by checking the box to indicate that the specified information has been included in the Stormwater Report. If any of the information specified in the checklist has not been submitted, the applicant must provide an explanation. The completed Stormwater Report Checklist and Certification must be submitted with the Stormwater Report.

[1] The Stormwater Report may also include the Illicit Discharge Compliance Statement required by Standard 10. If not included in the Stormwater Report, the Illicit Discharge Compliance Statement must be submitted prior to the discharge of stormwater runoff to the post-construction best management practices.

[2] For some complex projects, it may not be possible to include the Construction Period Erosion and Sedimentation Control Plan in the Stormwater Report. In that event, the issuing authority has the discretion to issue an Order of Conditions that approves the project and includes a condition requiring the proponent to submit the Construction Period Erosion and Sedimentation Control Plan before commencing any land disturbance activity on the site.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

B. Stormwater Checklist and Certification

The following checklist is intended to serve as a guide for applicants as to the elements that ordinarily need to be addressed in a complete Stormwater Report. The checklist is also intended to provide conservation commissions and other reviewing authorities with a summary of the components necessary for a comprehensive Stormwater Report that addresses the ten Stormwater Standards.

Note: Because stormwater requirements vary from project to project, it is possible that a complete Stormwater Report may not include information on some of the subjects specified in the Checklist. If it is determined that a specific item does not apply to the project under review, please note that the item is not applicable (N.A.) and provide the reasons for that determination.

A complete checklist must include the Certification set forth below signed by the Registered Professional Engineer who prepared the Stormwater Report.

Registered Professional Engineer's Certification

I have reviewed the Stormwater Report, including the soil evaluation, computations, Long-term Pollution Prevention Plan, the Construction Period Erosion and Sedimentation Control Plan (if included), the Long-term Post-Construction Operation and Maintenance Plan, the Illicit Discharge Compliance Statement (if included) and the plans showing the stormwater management system, and have determined that they have been prepared in accordance with the requirements of the Stormwater Management Standards as further elaborated by the Massachusetts Stormwater Handbook. I have also determined that the information presented in the Stormwater Checklist is accurate and that the information presented in the Stormwater Report accurately reflects conditions at the site as of the date of this permit application.

Registered Professional Engineer Block and Signature

Signature and Date

Checklist

Project Type: Is the application for new development, redevelopment, or a mix of new and redevelopment?

☐ New development

☒ Redevelopment

☐ Mix of New Development and Redevelopment

Checklist for Stormwater Report

Checklist (continued)

LID Measures: Stormwater Standards require LID measures to be considered. Document what environmentally sensitive design and LID Techniques were considered during the planning and design of the project:

☐ No disturbance to any Wetland Resource Areas

☐ Site Design Practices (e.g. clustered development, reduced frontage setbacks)

☒ Reduced Impervious Area (Redevelopment Only)

☒ Minimizing disturbance to existing trees and shrubs

☐ LID Site Design Credit Requested:

- ☐ Credit 1
- ☐ Credit 2
- ☐ Credit 3

☒ Use of "country drainage" versus curb and gutter conveyance and pipe

☒ Bioretention Cells (includes Rain Gardens)

☐ Constructed Stormwater Wetlands (includes Gravel Wetlands designs)

☐ Treebox Filter

☐ Water Quality Swale

☒ Grass Channel

☐ Green Roof

☐ Other (describe): _____

Standard 1: No New Untreated Discharges

☒ No new untreated discharges

☐ Outlets have been designed so there is no erosion or scour to wetlands and waters of the Commonwealth

☐ Supporting calculations specified in Volume 3 of the Massachusetts Stormwater Handbook included.

Checklist for Stormwater Report

Checklist (continued)

Standard 2: Peak Rate Attenuation

☐ Standard 2 waiver requested because the project is located in land subject to coastal storm flowage and stormwater discharge is to a wetland subject to coastal flooding.

☐ Evaluation provided to determine whether off-site flooding increases during the 100-year 24-hour storm.

☒ Calculations provided to show that post-development peak discharge rates do not exceed pre-development rates for the 2-year and 10-year 24-hour storms. If evaluation shows that off-site flooding increases during the 100-year 24-hour storm, calculations are also provided to show that post-development peak discharge rates do not exceed pre-development rates for the 100-year 24-hour storm.

Standard 3: Recharge

☐ Soil Analysis provided.

☒ Required Recharge Volume calculation provided.

☐ Required Recharge volume reduced through use of the LID site Design Credits.

☐ Sizing the infiltration, BMPs is based on the following method: Check the method used.

☒ Static ☐ Simple Dynamic ☐ Dynamic Field[1]

☒ Runoff from all impervious areas at the site discharging to the infiltration BMP.

☐ Runoff from all impervious areas at the site is *not* discharging to the infiltration BMP and calculations are provided showing that the drainage area contributing runoff to the infiltration BMPs is sufficient to generate the required recharge volume.

☐ Recharge BMPs have been sized to infiltrate the Required Recharge Volume.

☒ Recharge BMPs have been sized to infiltrate the Required Recharge Volume *only* to the maximum extent practicable for the following reason:

- ☒ Site is comprised solely of C and D soils and/or bedrock at the land surface
- ☐ M.G.L. c. 21E sites pursuant to 310 CMR 40.0000
- ☐ Solid Waste Landfill pursuant to 310 CMR 19.000
- ☐ Project is otherwise subject to Stormwater Management Standards only to the maximum extent practicable.

☒ Calculations showing that the infiltration BMPs will drain in 72 hours are provided.

☐ Property includes a M.G.L. c. 21E site or a solid waste landfill and a mounding analysis is included.

[1] 80% TSS removal is required prior to discharge to infiltration BMP if Dynamic Field method is used.

Checklist for Stormwater Report

Checklist (continued)

Standard 3: Recharge (continued)

☐ The infiltration BMP is used to attenuate peak flows during storms greater than or equal to the 10-year 24-hour storm and separation to seasonal high groundwater is less than 4 feet and a mounding analysis is provided.

☐ Documentation is provided showing that infiltration BMPs do not adversely impact nearby wetland resource areas.

Standard 4: Water Quality

The Long-Term Pollution Prevention Plan typically includes the following:

- Good housekeeping practices;
- Provisions for storing materials and waste products inside or under cover;
- Vehicle washing controls;
- Requirements for routine inspections and maintenance of stormwater BMPs;
- Spill prevention and response plans;
- Provisions for maintenance of lawns, gardens, and other landscaped areas;
- Requirements for storage and use of fertilizers, herbicides, and pesticides;
- Pet waste management provisions;
- Provisions for operation and management of septic systems;
- Provisions for solid waste management;
- Snow disposal and plowing plans relative to Wetland Resource Areas;
- Winter Road Salt and/or Sand Use and Storage restrictions;
- Street sweeping schedules;
- Provisions for prevention of illicit discharges to the stormwater management system;
- Documentation that Stormwater BMPs are designed to provide for shutdown and containment in the event of a spill or discharges to or near critical areas or from LUHPPL;
- Training for staff or personnel involved with implementing Long-Term Pollution Prevention Plan;
- List of Emergency contacts for implementing Long-Term Pollution Prevention Plan.

☐ A Long-Term Pollution Prevention Plan is attached to Stormwater Report and is included as an attachment to the Wetlands Notice of Intent.

☒ Treatment BMPs subject to the 44% TSS removal pretreatment requirement and the one inch rule for calculating the water quality volume are included, and discharge:

- ☐ is within the Zone II or Interim Wellhead Protection Area
- ☒ is near or to other critical areas
- ☐ is within soils with a rapid infiltration rate (greater than 2.4 inches per hour)
- ☐ involves runoff from land uses with higher potential pollutant loads.

☐ The Required Water Quality Volume is reduced through use of the LID site Design Credits.

☒ Calculations documenting that the treatment train meets the 80% TSS removal requirement and, if applicable, the 44% TSS removal pretreatment requirement, are provided.

Checklist for Stormwater Report

Checklist (continued)

Standard 4: Water Quality (continued)

☐ The BMP is sized (and calculations provided) based on:

☒ The ½" or 1" Water Quality Volume or

☐ The equivalent flow rate associated with the Water Quality Volume and documentation is provided showing that the BMP treats the required water quality volume.

☐ The applicant proposes to use proprietary BMPs, and documentation supporting use of proprietary BMP and proposed TSS removal rate is provided. This documentation may be in the form of the propriety BMP checklist found in Volume 2, Chapter 4 of the Massachusetts Stormwater Handbook and submitting copies of the TARP Report, STEP Report, and/or other third party studies verifying performance of the proprietary BMPs.

☐ A TMDL exists that indicates a need to reduce pollutants other than TSS and documentation showing that the BMPs selected are consistent with the TMDL is provided.

Standard 5: Land Uses With Higher Potential Pollutant Loads (LUHPPLs)

☐ The NPDES Multi-Sector General Permit covers the land use and the Stormwater Pollution Prevention Plan (SWPPP) has been included with the Stormwater Report.

☒ The NPDES Multi-Sector General Permit covers the land use and the SWPPP will be submitted ***prior to*** the discharge of stormwater to the post-construction stormwater BMPs.

☐ The NPDES Multi-Sector General Permit does ***not*** cover the land use.

☐ LUHPPLs are located at the site and industry specific source control and pollution prevention measures have been proposed to reduce or eliminate the exposure of LUHPPLs to rain, snow, snow melt and runoff, and been included in the long term Pollution Prevention Plan.

☐ All exposure has been eliminated.

☐ All exposure has ***not*** been eliminated and all BMPs selected are on MassDEP LUHPPL list.

☐ The LUHPPL has the potential to generate runoff with moderate to higher concentrations of oil and grease (e.g. all parking lots with >1000 vehicle trips per day) and the treatment train includes an oil grit separator, a filtering bioretention area, a sand filter or equivalent.

Standard 6: Critical Areas

☒ The discharge is near or to a critical area and the treatment train includes only BMPs that MassDEP has approved for stormwater discharges to or near that particular class of critical area.

☐ Critical areas and BMPs are identified in the Stormwater Report.

Checklist for Stormwater Report

Checklist (continued)

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the maximum extent practicable

☒ The project is subject to the Stormwater Management Standards only to the maximum Extent Practicable as a:

☐ Limited Project

☐ Small Residential Projects: 5-9 single family houses or 5-9 units in a multi-family development provided there is no discharge that may potentially affect a critical area.

☐ Small Residential Projects: 2-4 single family houses or 2-4 units in a multi-family development with a discharge to a critical area

☐ Marina and/or boatyard provided the hull painting, service and maintenance areas are protected from exposure to rain, snow, snow melt and runoff

☐ Bike Path and/or Foot Path

☒ Redevelopment Project

☐ Redevelopment portion of mix of new and redevelopment.

☐ Certain standards are not fully met (Standard No. 1, 8, 9, and 10 must always be fully met) and an explanation of why these standards are not met is contained in the Stormwater Report.

☐ The project involves redevelopment and a description of all measures that have been taken to improve existing conditions is provided in the Stormwater Report. The redevelopment checklist found in Volume 2 Chapter 3 of the Massachusetts Stormwater Handbook may be used to document that the proposed stormwater management system (a) complies with Standards 2, 3 and the pretreatment and structural BMP requirements of Standards 4-6 to the maximum extent practicable and (b) improves existing conditions.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control

A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan must include the following information:

- Narrative;
- Construction Period Operation and Maintenance Plan;
- Names of Persons or Entity Responsible for Plan Compliance;
- Construction Period Pollution Prevention Measures;
- Erosion and Sedimentation Control Plan Drawings;
- Detail drawings and specifications for erosion control BMPs, including sizing calculations;
- Vegetation Planning;
- Site Development Plan;
- Construction Sequencing Plan;
- Sequencing of Erosion and Sedimentation Controls;
- Operation and Maintenance of Erosion and Sedimentation Controls;
- Inspection Schedule;
- Maintenance Schedule;
- Inspection and Maintenance Log Form.

☒ A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan containing the information set forth above has been included in the Stormwater Report.

Checklist for Stormwater Report

Checklist (continued)

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control (continued)

☐ The project is highly complex and information is included in the Stormwater Report that explains why it is not possible to submit the Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan with the application. A Construction Period Pollution Prevention and Erosion and Sedimentation Control has ***not*** been included in the Stormwater Report but will be submitted ***before*** land disturbance begins.

☐ The project is ***not*** covered by a NPDES Construction General Permit.

☐ The project is covered by a NPDES Construction General Permit and a copy of the SWPPP is in the Stormwater Report.

☒ The project is covered by a NPDES Construction General Permit but no SWPPP been submitted. The SWPPP will be submitted BEFORE land disturbance begins.

Standard 9: Operation and Maintenance Plan

☒ The Post Construction Operation and Maintenance Plan is included in the Stormwater Report and includes the following information:

- ☐ Name of the stormwater management system owners;
- ☐ Party responsible for operation and maintenance;
- ☐ Schedule for implementation of routine and non-routine maintenance tasks;
- ☐ Plan showing the location of all stormwater BMPs maintenance access areas;
- ☐ Description and delineation of public safety features;
- ☐ Estimated operation and maintenance budget; and
- ☐ Operation and Maintenance Log Form.

☐ The responsible party is ***not*** the owner of the parcel where the BMP is located and the Stormwater Report includes the following submissions:

- ☐ A copy of the legal instrument (deed, homeowner's association, utility trust or other legal entity) that establishes the terms of and legal responsibility for the operation and maintenance of the project site stormwater BMPs;
- ☐ A plan and easement deed that allows site access for the legal entity to operate and maintain BMP functions.

Standard 10: Prohibition of Illicit Discharges

☒ The Long-Term Pollution Prevention Plan includes measures to prevent illicit discharges;

☐ An Illicit Discharge Compliance Statement is attached;

☐ NO Illicit Discharge Compliance Statement is attached but will be submitted ***prior to*** the discharge of any stormwater to post-construction BMPs.

Stormwater Report Narrative

This Stormwater Report has been prepared to demonstrate compliance with the Massachusetts Stormwater Management Standards in accordance with the Massachusetts Wetlands Protection Act Regulations (310 CMR 10.00) and Water Quality Certification Regulations (314 CMR 9.00).

Project Description

The Applicant, MassDOT, is proposing to construct a train station at Raynham Park located at 1958 Broadway Street in Raynham, Massachusetts along the Stoughton Rail Road Line (the Project). The Project will involve a center platform with canopy, ancillary landscape improvements, 432 parking spaces, bicycle parking facilities, and utility improvements to support this use. The Project involves demolishing abandoned kennels and several small buildings that currently exist on the site.

The site is not considered a Land Use with Higher Potential Pollutant Loads (LUHPPL) as defined in 3.10 CMR 10.04 and 314 CMR 9.02 because it is not a parking lot with a high-intensity use (1,000 vehicle trips per day or more).

Site Description

The Project Site is an 11.4-acre parcel of land (the Site) located at 1958 Broadway Street in Raynham, Massachusetts (see Figure 1, Site Locus Map and Figure 2, Site Aerial). The site is located to the south of the former Raynham Park Greyhound Track and is adjacent to industrial buildings to the south, Route 138 (Broadway) to the east, and the MBTA railroad right-of-way to the west.

Wetland Resource Areas on the Site, shown on Figures 3 and 4, are described in Table 1. For additional information regarding the wetland resource areas present on the site see the Abbreviated Notice of Resource Area Delineation (ANRAD) prepared by VHB dated May 2011.

Table 1
Wetland Resource Areas

Name	*Critical Area*	*Zone 1 or Zone A*	*ORW or SRW*	*Zone II or IWPA*	*Description*
Wetland R62.1	No	No	No	No	PSS/PEM/OW
Wetland R4	No	No	No	No	PFO
Wetland R5	No	No	No	No	PFO

Notes: Wetland Classifications: OW = Open Water, PEM = Palustrine Emergent, PFO = Palustrine Forested, PSS = Palustrine Scrub/Shrub

According to the National Resources Conservation Service (NRCS), surface soils on the Site include Scarboro mucky loamy fine sand, Whitman fine sandy loam, and Urban land, and are all classified as Hydrologic Soil Groups (HSG) D. Based on the soil evaluation, the Site is not considered to be within an area of rapid infiltration (soils with a saturated hydraulic conductivity greater than 2.4 inches per hour) and high bedrock is indicated. The poorly drained soils onsite have a very low potential for infiltration. According to 1982 Rawls Rates, infiltration rates for the soils will be approximately 0.09 inches per hour.

The project is not located within the 100-year flood plain as shown on the FEMA Floodway Map, Town of Raynham, Massachusetts Bristol County, Community Panel Number 25005C0152F dated July 7, 2009. This map is included in Appendix B.

Existing Drainage Conditions

Under existing conditions the Site is almost entirely developed, impervious land. For the existing conditions hydrologic analysis, the site was divided into four drainage areas that contribute to four separate design points. The following is a summary of each drainage area.

Drainage Area 1 – This 6.85-acre area in the northeast portion of the site consists mainly of urban land that includes both paved and dirt roads. This area sheet flows, untreated, to the existing parking lot to the north where it is captured by the closed drainage system on the adjacent parcel.

Drainage Area 2 – This 1.63-acre area in the southeast portion of the site consists mainly of paved areas and some small dirt roads that sheet flows, untreated, to Wetland R5 east of the site.

Drainage Area 3 – This 7.54-acre area in the northwest portion of the site consists predominantly of paved areas with small patches of grassed areas that sheet flows, untreated, to the parking area to the north where it is captured by a closed drainage system on the adjacent parcel.

Drainage Area 4 – This 3.94-acre area in the southwest portion of the site consists predominantly of urban land that includes paved parking areas and driveways and small buildings and kennels. This area sheet flows, untreated, to the west to Wetland R62.1 via an unnamed perennial stream that continues to flow to the north.

Figure 3 illustrates the existing drainage patterns on the Site. Table 2 below provides a summary of the existing conditions hydrologic data.

Table 2
Existing Conditions Hydrologic Data

Drainage Area	*Discharge Location*	*Design Point*	*Area (acres)*	*Curve Number*	*Time of Concentration (min)*
1	Adjacent Parking Area	1	6.85	97	6.1
2	Wetland R5	2	1.63	94	3.7
3	Adjacent Parking Area / Drainage System	3	7.54	94	19.6
4	Wetland R62.1 (Perennial Stream)	4	3.94	89	17.1

Proposed Drainage Conditions

Figure 4 illustrates the proposed "post construction" drainage conditions for the project. As shown, the Site would be divided into four drainage areas that discharge treated stormwater to the same four existing Design Points. Existing drainage and grading patterns were maintained to the maximum extent possible in proposed conditions. Low impact development stormwater management techniques have been incorporated into the design. These practices are focused on decentralizing stormwater management techniques into the design that will reduce peak runoff rates, maximize groundwater recharge and treat for water quality. The following is a summary of each drainage area.

Drainage Areas 1 (1.1 & 1.2) – These two drainage areas combined, are the 6.60-acre area in the northeast portion of the site that consists of existing landscaped and broken pavement area that would remain unchanged in proposed conditions and a paved driveway leading to the station. The paved driveway of this area will sheet flow into two new grassed swales and then conveyed into a bioretention basin for treatment. During large events the bioretention basin will overflow at a designed overflow weir and sheet flow across the adjacent parcel and be captured by the catch basins as it does in existing conditions. The landscaped and broken paved areas would continue to sheet flow as it does in existing conditions before being captured by catch basins and discharged to the existing closed drainage system on the adjacent parcel.

Drainage Area 2 – This 2.03-acre area in the southeast portion of the site will be an entirely landscaped area and would sheet flow to Wetland R5 east of the site. Under existing conditions this area is predominantly pavement and discharges, untreated, to the same design point.

Drainage Area 3.1 – This 2.04-acre area in the northwest portion of the site will consist of paved parking areas for the station and landscaped islands . The paved parking areas for the station would be collected by two deep sump hooded catch basins that then discharge to a sediment forebay and bioretention area for further treatment. In larger storm events the bioretention basin would overflow at a designed overflow weir and sheet flow to the adjacent parcel before being captured by the existing catch basins as it does under existing conditions.

Drainage Area 3.2 – This 5.71-acre area in the northwest portion of the site will consist of paved roadways and existing landscaped areas that would remain unchanged. This portion of the drainage area 3 would sheet flow, as it does in existing conditions, to the adjacent parcel before being captured by the existing catch basins as it does under existing conditions.

Drainage Area 4 – This 4.20-acre area in the southwest portion of the site will consist predominantly of paved parking areas for the station which will sheet flow through a gravel and grass filter strip then into a bioretention swale before being discharged to a culvert beneath the rail tracks and then to the unnamed perennial stream, as it does in existing conditions.

Table 3 below provides a summary of the proposed conditions hydrologic data.

Table 3
Proposed Conditions Hydrologic Data

Drainage Area	*Discharge Location*	*Design Point*	*Area (acres)*	*Curve Number*	*Time of Concentration (min)*
1	Adjacent Parking Area	1	6.60	95	8.4
2	Wetland R5	2	2.03	89	10.4
3.1	Adjacent Parking Area/Drainage System	3	2.04	96	14.1
3.2	Adjacent Parking Area/Drainage System	3	5.71	91	15.1
4	Wetland R62.1 (Perennial Stream)	4	4.20	91	16.6

The site has been designed with a comprehensive stormwater management system that has been developed in accordance with the Massachusetts Stormwater Handbook. Although the site does not discharge directly to a critical area, the proposed stormwater management system has been designed to treat the 1.0 inch Water Quality Volume, because drainage from the site ultimately discharges to an Area of Critical Environmental Concern (ACEC).

Environmentally Sensitive and Low Impact Development (LID) Techniques

Low Impact Development (LID) techniques and stormwater Best Management Practices (BMPs) incorporated in the site design include:

- Reduction of impervious area of 0.5 acres.
- Minimal disturbance to exiting trees and vegetation
- Grassed channel
- Gravel and grass filter strip
- Two bioretention basins and swales
- Bioretention swale

In general, stormwater runoff from all impervious surfaces in proposed conditions would receive some form of treatment for stormwater quality prior to discharge to the existing design points. Under existing conditions no such treatment is provided for stormwater runoff.

Hydraulic Analysis

The closed drainage system was designed for the 25-year storm event, in accordance with the Massachusetts Bay Transportation Authority, Railroad Operations, Commuter Rail Design Standards Manual, Volume 1.

Drainage pipes were sized using Manning's Equation for full-flow capacity and the Rational Method. Pipe sizing calculations are included in Appendix A of this report.

Regulatory Compliance

Massachusetts Department of Environmental Protection (DEP) - Stormwater Management Standards

As demonstrated below, the proposed Project fully complies with the DEP Stormwater Management Standards at 310 CMR 10.05.

Standard 1: No New Untreated Discharges or Erosion to Wetlands

The Project has been designed to fully comply with Standard 1.

The Best Management Practices (BMPs) included in the proposed stormwater management system have been designed in accordance with the Massachusetts Stormwater Handbook. Supporting information and computations demonstrating that no new untreated discharges would result from the Project are presented through compliance with Standards 4 through 6.

All proposed Project stormwater outlets and conveyances have been designed to not cause erosion or scour to wetlands or receiving waters. Outlets from closed drainage systems have been designed with flared end sections and stone protection to dissipate discharge velocities. Overflows from BMPs that impound stormwater have been designed with stone to protect down gradient areas from erosion.

Computations and supporting information for the sizing and selection of materials used to protect from scour and erosion are included in Appendix A.

Standard 2: Peak Rate Attenuation

The Project has been designed to fully comply with Standard 2.

The rainfall-runoff response of the Site under existing and proposed conditions was analyzed for storm events with recurrence intervals of 2, 10, and 100-years. The results of the analysis, as summarized in Table 4 below, indicate that there is no increase in peak discharge rates between the existing and proposed conditions.

Computations and supporting information regarding the hydrologic modeling are included in Appendix B.

Table 4
Peak Discharge Rates (cfs*)

Design Point	*2-year*	*10-year*	*100-year*
Design Point 1: Adjacent Parking Area			
Existing	21.8	31.1	45.7
Proposed	16.9	27.6	41.0
Design Point 2: Wetland R5			
Existing	5.3	7.8	11.6
Proposed	3.1	5.5	9.5
Design Point 3: Adjacent Parking Area/Drainage System			
Existing	15.8	23.2	34.7
Proposed	12.1	18.4	28.1
Design Point 4: Wetland R62.1			
Existing	7.4	11.6	18.0
Proposed	4.9	9.6	15.8

Standard 3: Stormwater Recharge

Due to the fact the site is comprised wholly of C and D soils and high bedrock as indicated in the geotechnical report, the project currently does not provide significant recharge and has been designed to infiltrate the required recharge volume to the maximum extent possible. The addition of pervious area and better subgrade soils in proposed basins will contribute to improved recharge.

Each infiltration BMP has been designed with an underdrain, due to the poor soils so it will drain completely within 72 hours.

A Geotechnical Report that describes subsurface soil conditions is included as an appendix to this report.

Standard 4: Water Quality

The Project has been designed to fully comply with Standard 4.

The proposed stormwater management system implements a treatment train of BMPs that has been designed to provide a minimum of 80% TSS removal for stormwater runoff from all proposed impervious surfaces. While not required, one-inch of water quality treatment for impervious surface runoff has been provided since the Site is in close proximity to the Hockomock Swamp Area of Critical Environmental Concern (ACEC).

Standard 5: Land Uses with Higher Potential Pollutant Loads (LUHPPLs)

The site is not considered a LUHPPL as defined in 3.10 CMR 10.04 and 314 CMR 9.02 because it is not a parking lot with a high-intensity use (1,000 vehicle trips per day or more).

Standard 6: Critical Areas

The Project would discharge treated storm water near a critical area, the Hockomock Swamp Area of Critical Environmental Concern, via an unnamed stream and therefore has been designed with suitable BMPs sized to treat the 1-inch Water Quality Volume and provide the pretreatment requirement of 44% TSS removal prior to infiltration. Proposed source controls and pollution prevention measures have been identified in the Long-Term Pollution Prevention Plan for the project.

For computations and supporting information regarding the sizing of BMPs suitable for treatment of runoff near or to critical areas, see Appendix D.

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the Maximum Extent Practicable

The Project is a redevelopment, but has still been designed to fully comply with all ten of the Stormwater Management Standards.

Refer directly to each Standard for applicable computations and supporting information demonstrating compliance with each.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Controls

The Project would disturb approximately 11.4 acres of land and is therefore required to obtain coverage under the Environmental Protection Agency (EPA) National Pollutant Discharge Elimination System (NPDES) Construction General Permit (CGP). As required under this permit, a Stormwater Pollution Prevention Plan (SWPPP) would be developed and a Notice of Intent for the CGP would be submitted by the contractor and owner at least 14 days before land disturbance begins. Recommended construction period pollution prevention and erosion and sedimentation controls were discussed in the DEIR/S. Appropriate controls will be prepared and implemented by the contractor and MassDOT (MBTA) during construction in accordance with the final design and NPDES SWPPP

Standard 9: Operation and Maintenance Plan

In compliance with Standard 9, a Post Construction Stormwater Operation and Maintenance (O&M) Plan will be developed by the MBTA during final design for the Project.

Standard 10: Prohibition of Illicit Discharges

Storm drainage structures remaining from the previous development which are part of the redevelopment area will be removed. The design plans submitted with this report have been designed so that the components included therein are in full compliance with current standards. No statement is made with regard to the drainage system in portions of the site not included in the redevelopment project area. The Long-Term Pollution Prevention Plan will include measures to prevent illicit discharges.

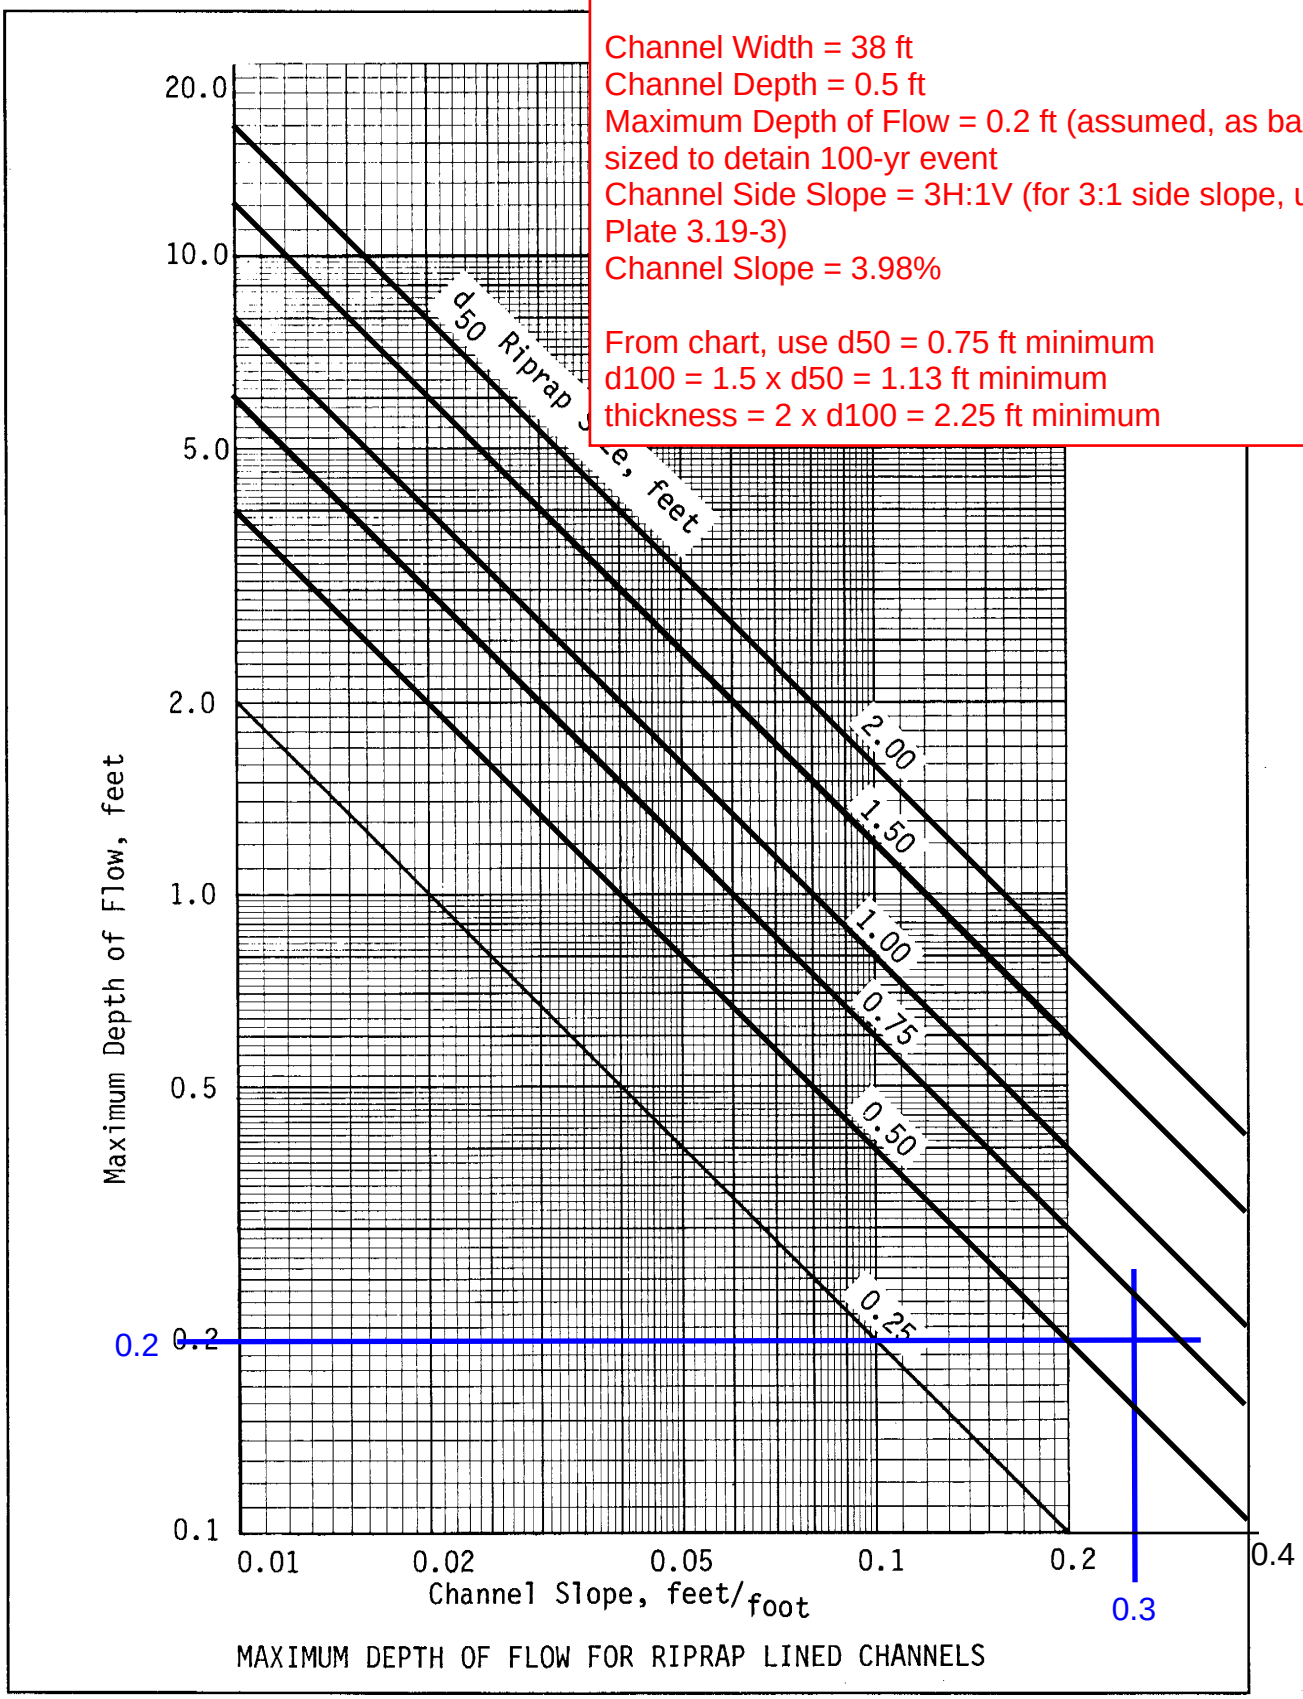
Date: April 2012 Location: Raynham, MA
Calculated By: DAG
Re: Bioretention Basin 1 Overflow Stone Sizing

Channel Width = 38 ft
Channel Depth = 0.5 ft
Maximum Depth of Flow = 0.2 ft (assumed, as basin is sized to detain 100-yr event
Channel Side Slope = 3H:1V (for 3:1 side slope, use Plate 3.19-3)
Channel Slope = 3.98%

From chart, use d50 = 0.75 ft minimum
d100 = 1.5 x d50 = 1.13 ft minimum
thickness = 2 x d100 = 2.25 ft minimum



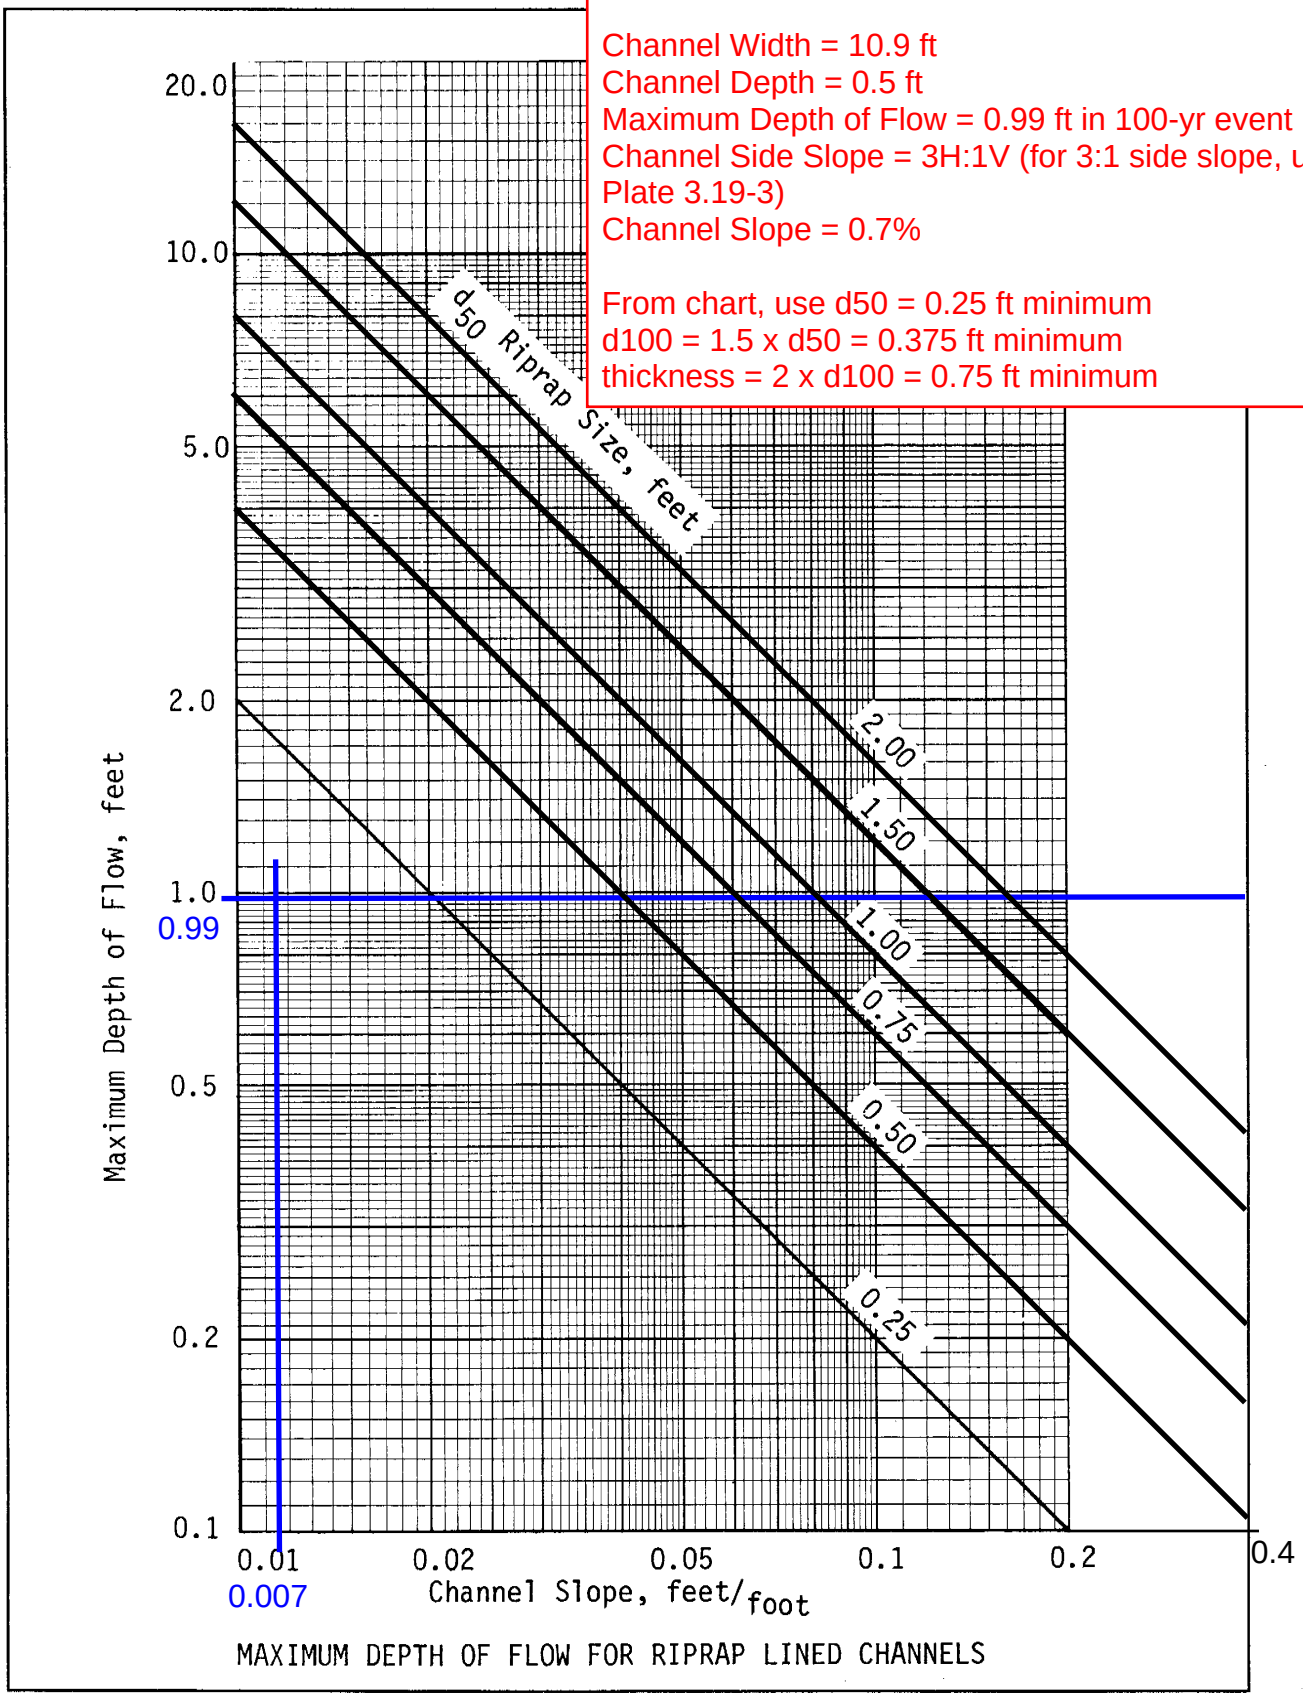
Source: VDOT Drainage Manual Plate 3.19-3

*Sizing calculations represent minimum stone size. Larger stone may be required per detail plans.

Project No: 10111 Project Name: SCR
Date: April 2012 Location: Raynham, MA
Calculated By: DAG
Re: Bioretention Basin 3 Overflow Stone Sizing

Channel Width = 10.9 ft
Channel Depth = 0.5 ft
Maximum Depth of Flow = 0.99 ft in 100-yr event
Channel Side Slope = 3H:1V (for 3:1 side slope, use Plate 3.19-3)
Channel Slope = 0.7%

From chart, use d50 = 0.25 ft minimum
d100 = 1.5 x d50 = 0.375 ft minimum
thickness = 2 x d100 = 0.75 ft minimum



Source: VDOT Drainage Manual Plate 3.19-3

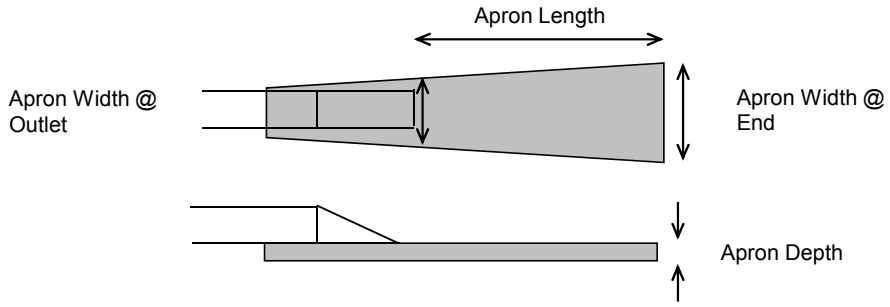
*Sizing calculations represent minimum stone size. Larger stone may be required per detail plans.

Project #:	10111		
Project:	Raynham Park Station - SCR		
Location:	Raynham, MA		
Calculated by:	DAG	Date:	April 4, 2012
Checked by:	VHB	Date:	April 4, 2012
Title:	Riprap Outlet Protection Sizing		

Sources: Massachusetts Erosion and Sediment Control Guidelines for Urban and Suburban Areas
Massachusetts Department of Environmental Protection - Reprinted 2003 (pp. 118-120)

Erosion and Sediment Control Handbook - Third Edition 1992 (Chapter 3.18)
Virginia Department of Conservation and Recreation (DCR)

Attachments: Virginia DCR Erosion and Sediment Control Handbook Plate 3.18-3



Apron Width at Outlet:	Width = 3 x pipe dia. (or width of channel)	
Apron Length:	Length = From Virginia DCR Handbook - Plate 3.18-3	if Tw depth is < 1/2 dia.
	Length = From Virginia DCR Handbook - Plate 3.18-4	if Tw dwpth is >= 1/2 dia.
Apron Width at End:	Width = dia. + apron length	if Tw depth is < 1/2 dia.
	Width = dia. + 0.4 x apron length	if Tw dwpth is >= 1/2 dia.
	or apron width = channel width if a well defined channel exists	
Rock Riprap:	Median Diameter (d_{50}) = From Virginia DCR Handbook - Plate 3.18-3 or 4	
	Largest stone dia = 1.5 x d_{50}	
Apron Depth:	6" or 1.5 x largest stone dia	

Design Element	Outlet Description FES C1
Design Storm (yr):	100
Defined Channel (yes/no)	no
Pipe Dia (D), in	22
Tail Water (Tw), ft	Tw < 0.5D during low tide
Flow (Q), cfs	17.4
Apron Width (outlet), ft	6
Apron Length, ft	17
Apron Width (end), ft	19
Median Stone Dia., ft	0.50
Median Stone Dia., in	6
Largest Stone Dia., ft	0.75
Largest Stone Dia., in	9
Apron Depth, ft	1
Apron Depth, in	14

Appendix B
Standard 2 Computations and Supporting Information

Rainfall volumes used for this analysis were based on the Natural Resources Conservation Service (NRCS) Type III, 24-hour storm event for Bristol County. Runoff coefficients for the existing and proposed conditions, as previously shown in Tables 1 and 2 respectively, were determined using NRCS Technical Release 55 (TR-55) methodology as provided in HydroCAD. The HydroCAD model is based on the NRCS Technical Release 20 (TR-20) Model for Project Formulation Hydrology.

MAP INFORMATION

Map Scale: 1:4,920 if printed on A size (8.5" × 11") sheet.

The soil surveys that comprise your AOI were mapped at 1:20,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for accurate map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: UTM Zone 19N NAD83

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Bristol County, Massachusetts, Northern Part
Survey Area Data: Version 5, Jul 27, 2010

Date(s) aerial images were photographed: 7/10/2003; 7/31/2003

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Design Memorandum

Date	February 29, 2012
To	Rick Carey, Natasha Velickovic - VHB
From	Paul Murphy, Da Ha, Peter Chou - Jacobs
Subject	MBTA South Coast Rail (New Bedford/Fall River Commuter Rail Extension) Raynham Park Station Geotechnical Design Memorandum Raynham, MA
Project No.	E2347101

INTRODUCTION

The South Coast Rail project will restore passenger rail transportation from South Station in Boston to the cities of Fall River and New Bedford along an existing rail freight corridor running south from Taunton to Fall River and New Bedford. The project will include the construction of several existing and new passenger stations and two terminal layover facilities. This geotechnical design memorandum presents the foundation design considerations for the new station platform at the proposed Raynham Park Station in Raynham, Massachusetts. The design recommendations presented in this report are based on the results of subsurface investigation performed by Jacobs in 2010.

Existing Conditions

The proposed Raynham Park Station is at the site of the Raynham-Taunton Greyhound Track, off Route 138 in Raynham, MA (Figure 1). The station site itself is within a larger, developed site that contains industrial facilities, a telephone pole storage yard, the greyhound track and associated uses, and a parking area. Existing grades at the platform location range from elevations 92 to 96 feet (NGVD29 Datum), generally sloping downward from south to north. The existing buildings and their foundations will need to be removed.

Proposed Construction

Current station plans are to construct an 800 foot long, 12 foot wide high level center platform adjacent to the existing tracks with some track relocation required, as well as the addition of a second track, a new parking area, access roads, and a new drop-off area. Access to the platform will be from a new ramp/stair structure along the east side of the tracks with a bridge over the track to the platform. Approximately 400 feet of the platform will be under a canopy. The details of new track layout (including grading), associated sidewalks and ramps of the proposed station are still under development at the time of this report preparation. This report focuses on the foundations for the platform only.

SCOPE OF WORK

This memorandum was prepared by Jacobs in accordance with the scope of work under the contract between Jacobs and VHB for work on the New Bedford/Fall River Commuter Rail Line Extension Project for Massachusetts Bay Transportation Authority (MBTA). The geotechnical work included the following tasks:

- Perform a geotechnical exploration and laboratory testing program;
- Report and interpret the results of the exploration and laboratory testing program; and

- Provide geotechnical recommendations for design and construction of the platform foundations.

The Jacobs scope of work did not include environmental analyses to assess the potential presence of any hazardous materials at the project site.

LOCAL GEOLOGY

The site is located in the Narragansett Basin of southeastern Massachusetts. The rocks in the Narragansett Basin consist mostly of lightly metamorphosed shale and sandstone of Pennsylvanian and Permian age. The Raynham Park Station is located in the area of the Rhode Island Formation. The rocks encountered in the borings include conglomerate, sandstone, greywacke and siltstone. These rocks are all similar in that they are strongly cemented mixtures of fine to coarse sand with silt. Conglomerate includes gravel; greywacke includes all grain sizes, including a high percentage of fines. Weathering in these rocks commonly involves the breakdown of the mineral cements leading to eventual disaggregation of the matrix and the formation of residual soil. The rocks in the borings had sub-horizontal joints that appear to follow the bedding in the rock. These joints are probably the result of vertical unloading following deglaciation.

The top of rock was encountered in the borings between elevation 103 feet and elevation 84 feet. The thickness of overburden above the rock ranged from 26 feet to less than one foot.

GEOTECHNICAL EXPLORATIONS

Jacobs planned the subsurface exploration program and retained the drilling contractor (New Hampshire Boring) to perform the explorations. The geotechnical data report was submitted in 2010. Seven borings (RPS-1 to RPS-7) were conducted in the general vicinity of the proposed station platform area and eighteen borings (RPS-8, RPS-10, RPS-12 to RPS-26 and RPS-28) were drilled in the general vicinity of the proposed parking lot and its access roads. Boring locations are shown on the Subsurface Exploration Plan (Figures 2 & 3).

The borings were drilled by New Hampshire Boring using either a CME-550 or D-50 ATV mounted drill rig, or a CME-75 truck mounted drill rig. The borings were advanced through the soil by hollow-stem auger or wash boring methods using a 4-inch casing and roller bit with water. Standard penetration tests (SPT), consisting of a 140-pound hammer dropping 30 inches on a standard 2-inch-diameter (OD) split-spoon sampler, were performed with a safety hammer or automatic hammer to establish the consistency of the subsurface soils. The SPT's were typically performed at five foot intervals of depth. The obtained samples were sealed in glass jars to retain their natural moisture. Bedrock was encountered and cored around the proposed platform area.

The borings were observed and logged by a representative from Jacobs. The soil samples were classified in the field in accordance with ASTM D-2488, Standard Practice for Description and Identification of Soils (Visual-Manual Procedure) by Jacobs' representative, and appropriate stratum breaks were interpolated from drilling and sampling observations. The boring logs were prepared by Jacobs based on the field classifications and laboratory testing, and are presented in Appendix A.

LABORATORY TESTING

The results of the laboratory testing were previously submitted to VHB in a report entitled "South Coast Rail, Jacobs Geotechnical Data Report", dated November 2010.

Grain size distribution analyses were performed to evaluate the gradation of the natural granular soils for potential reuse as backfill, if needed, and to confirm sample classifications. The analyses are summarized in Table 1 below and are presented in Appendix B.

Table 1: Laboratory Soil Classification Summary

BORING NO.	SAMPLE NO.	ELEVATION (FEET)	USCS SOIL CLASSIFICATION	W (%)	GRAVEL (%)	SAND (%)	FINES (%)
RPS – 4 OW	S2	90.0	Silty Sand w/ Gravel (SM)	NT	37.7	45.2	17.1
RPS – 13 OW	S3	93.0	Silty Sand w/ Gravel (SM)	6.2	16.0	49.6	34.4
RPS - 16	S3	95.0	Silty Sand (SM)	11.6	4.9	74.8	20.3
RPS - 19	S4	92.0	Sandy Silt (ML)	2.7	6.0	44.4	49.6
RPS - 22	S3	97.0	Sandy Silt (ML)	14.5	6.0	40.0	54.0

Where: w = natural moisture content, NT = Not Tested.

SUBSURFACE CONDITIONS

The subsurface conditions at the site were inferred from the boring data collected for the Raynham Park Station project, with some interpretations. The subsurface conditions encountered at the station platform area generally consist of a relatively thin layer of granular fill with thickness of about 0 to 3 feet, underlain by a granular soil layer with thickness ranging from 0 to 10 feet overlying bedrock. Bedrock was encountered at a depth of about 0.7 to 10 feet in the platform area, corresponding to approximately elevations 86.0 to 103.0 feet.

Fill materials with thicknesses ranging from approximately 0 to 10 feet, were also encountered in the vicinity of the proposed parking lot and access roads area. Bedrock was encountered at a depth about 2 to 21 feet (corresponding to elevations 84.0 to 101.0 feet). Shallower bedrock was found on the north side of the parking lot and in the area of the proposed Pond 1.

Subsurface soil conditions are summarized in Table 2 and discussed below.

Table 2: Summary of Subsurface Conditions at Borings

NE: Not encountered at the boring during drilling. NR: Not recorded							

Soil conditions in the platform area generally consisted of the following:

Fill: The fill layer typically consists of mostly granular, loose to medium dense sand or gravel with up to 10% silt. The fill layer is generally about 0 to 3 feet thick in the area of the platform.

Natural Granular Deposits: The natural soil deposits below the fill generally consist of predominantly sand with gravel. These deposits are medium dense to very dense with Standard Penetration Test (SPT) N-values ranging between 15 and more than 50 blows per foot (bpf).

Bedrock: Bedrock was encountered in the platform area near ground surface to a depth of 10 feet below existing ground surface, corresponding to approximately elevations 86.0 to 92.3 feet. The bedrock was fine grained, severely jointed and joint weathering SANDSTONE or highly jointed, moderately weathered CONGLOMERATE. Bedrock RQD values at the platform range from zero to 47.

Bedrock was encountered at elevations ranging from about 84.0 to 103.0 feet in other site areas.

Groundwater: Groundwater levels were measured in the observation wells and in test borings using a weighted tape during and at completion of drilling. The data indicated the groundwater level ranged from approximate elevations 89.5 to 104 feet along the platform alignment, and from elevations 98 to 102 feet in the general area of the proposed parking lot. The use of wash boring techniques for some of the soil borings may have artificially increased the water level readings due to the addition of water to the borings. Trapped/perched water is also commonly seen at a higher elevation within existing fill and silty materials. The longer term water level readings taken at Boring RPS–04 OW on July 7, 2010 indicated the water at a depth of about 3.5 feet (Elevation 89.5 feet). The longer term water level readings taken at Boring RPS–13 OW on July 7, 2010 and September 12, 2011 indicated the water at a depth of about 7.5 feet (Elevation 99.5 feet) and 4.7 feet (Elevation 102.3 feet). Based upon these short-term observations and readings from the observation wells, it is anticipated that the groundwater could be within 3 to 4 feet below existing grade at the platform area and within 4 to 8 feet below grade in the parking lot area.

Groundwater levels should be expected to fluctuate with rainfall and other seasonal variations. More long-term observations would be required to evaluate true groundwater levels and their influence on planned construction. Local and periodic variations of ground water elevations may also be influenced by local subsurface drainage, leaking water or sewer pipes, and precipitation.

GEOTECHNICAL RECOMMENDATIONS

Based on the review of available subsurface conditions, the proposed station platforms can be supported on spread footings bearing directly within either competent natural soil, structural fill placed above suitable natural soils or on bedrock. Platform and canopy design loads were not available at the time of this report preparation. However, it is anticipated that the station platform will be lightly (axially) loaded with limited horizontal forces from wind and seismic loads.

The following paragraphs provide project specific geotechnical recommendations for foundation soil preparation, structural fill/backfill placement, and design and construction of spread footings.

Platform Foundations

Spread footings are recommended for the platform foundations, bearing on compacted structural fill, natural granular deposits, or bedrock. The existing fill is not suitable for support of the spread footings and should be removed within the zone of influence of the footing, defined by a line extending one foot horizontally from the bottom edge of footing and then down and away at a 1H:1V slope until natural granular soils or bedrock are encountered. The bottom of footing elevation should be at least 4 feet below final finished grades for frost protection for footings bearing on soil and at least 3 feet below final grade for footings bearing on bedrock.

The recommended allowable design bearing capacity for spread footings bearing on structural fill or natural sand and gravel deposits is 6 ksf, provided that subgrades are prepared as described herein. This provides an adequate factor of safety against bearing failure and limits the total estimated settlement to less than one inch and the differential settlement to less than ½ inch. For footings bearing directly on moderately weathered bedrock, we recommend an allowable bearing capacity of 16 ksf. However, since the actual bearing surface may not be known until construction, consideration should be given to designing all the footings for the 6 ksf bearing capacity. All footings should be at least 3 feet wide.

The structural fill material, if needed, should be free from organics and other deleterious substances and should conform to the requirements listed in the MBTA Standard Specification Section 02200 - Earthwork for Type B Gravel Borrow. The structural fill should be compacted to 95% of the maximum dry density as determined by the Modified Proctor compaction test (ASTM D1557).

All temporary open cuts required for footing construction should be in accordance with the related OSHA regulations and should have side slopes of no steeper than 1.5H:1V.

Seismic Consideration

The seismic design should comply with the requirements of the most current Massachusetts State Building Code 780 CMR and other relevant project design codes such as AREMA and AASHTO. Modification of the peak acceleration by the soils overlying bedrock depends upon the type of soil at the site. For the subsurface conditions encountered, the station site is classified as Seismic Site Class C soil profile in accordance with 780 CMR Chapter 1614.0 Section 9.4 Site Ground Motion. The structure could be designed for the total lateral seismic force using the equations specified in the code, or by the response spectrum method using the design spectra presented in the code. The maximum considered earthquake ground motions shall be as represented by the spectral response acceleration at short periods (Ss) and at 1-sec (S_1) obtained from Table 1604.10 of the Massachusetts State Building Code and adjusted for Site Class effects using the site coefficients of Section 9.4.1.2.4.

For Site Class C Soils at the location of this station:

S_{MS} = 0.288 and S_{M1} = 0.105

S_{DS} = 0.192 and S_{D1} = 0.070

where:

- S_{MS} is the maximum consider earthquake spectral response acceleration for short periods adjusted for site class
- S_{M1} is the maximum consider earthquake spectral response acceleration at 1-sec adjusted for site class
- S_{DS} is the design earthquake spectral response acceleration for short periods adjusted for site class
- S_{D1} is the design earthquake spectral response acceleration at 1-sec adjusted for site class

The building code also requires that the soil be evaluated for the following potential hazards: slope instability, soil liquefaction, or surface rupture due to faulting or lateral spreading. The proposed grading is relatively flat and we are not aware of any pre-existing slope instability in this area. The existing overburden soils do not appear to be subject to surface rupture due to faulting or lateral spreading.

Liquefaction

Based on the observed subsurface conditions, recorded water levels, percentage of fine contents and sample relative densities, the existing soils underlying the site are judged not susceptible to liquefaction.

CONSTRUCTION CONSIDERATIONS

Platform Foundations - Spread Footings

The existing fill should be stripped off and removed from within the zone of influence of the platform and any walkway areas down to natural granular deposits or bedrock using a smooth edge excavation bucket, and replaced by compacted granular soils.

Following excavation to the top of the natural granular deposits or bedrock, the exposed surface should be observed by an on-site representative of the project geotechnical engineer and soil subgrades shall be proof-compacted with at least 10 passes of a large vibratory drum roller. Any yielding areas should be observed by geotechnical personnel to assess if localized undercutting is necessary. Footing subgrade observations should include hand auger probes by the geotechnical personnel to check for soft/weak zones. The need for undercutting and backfilling with structural fill should be closely evaluated in the field based on encountered conditions.

If bedrock is encountered at the proposed bottom of footing elevation, the footing should either bear entirely on bedrock or entirely on soil. Where partial bedrock subgrade is encountered at the bottom of footing elevation, the bedrock should be over-excavated to a depth of at least 10 inches below the bottom of footing elevation and replaced with compacted Gravel Borrow to provide a uniform bearing surface.

In areas where seepage is encountered within footing excavations, the need for placing a 3" thick lean concrete mud mat or a layer of ¾-inch crushed stone to protect the bearing surface should be evaluated in the field. Crushed stone thicker than 4 inches shall be wrapped by non-woven filter fabric.

Following observation of the bearing soils by geotechnical personnel, reinforcing steel and concrete can be placed in the excavation. It is recommended that footing reinforcing steel and concrete be placed the same day as the footing excavation is made, where possible, to avoid significant moisture content changes in the bearing soils. No water should be allowed to pond within excavations and drainage should be maintained away from foundations both during and after construction. The footing excavation should be free of loose debris at the time of concrete placement.

Subgrade Preparation

Prior to performing any required grading operations and excavations in the proposed structure footprints, walkway and paved areas, these areas should be stripped of topsoil, vegetation, fill, former building foundations and existing pavement, if present. The topsoil should be placed in a designated area for reuse during final grading. Following site clearing and stripping, the exposed soil subgrade should be proof compacted with 10 passes of a large vibratory drum roller (minimum 10,000 pound static weight). Any pockets of excessively soft, wet or disturbed soil or unsuitable soils should be removed and replaced with properly compacted fill materials. Where subgrade soils are close to the existing groundwater level or where silty subgrade soils are encountered, proof-compaction using non-vibratory methods may be considered by the geotechnical engineer. Bedrock subgrades shall be free of all loose, fractured bedrock.

If additional rolling does not correct the unstable condition, the subgrade should be scarified to a depth of at least six inches but not exceeding eighteen inches, aerated, re-compacted, and retested to provide uniform compaction. Following satisfactory compaction of the subgrade, controlled compacted fill material should be placed to bring the site to the required grade.

Fill should not be placed over frozen soil. Soil subgrades should be protected against frost both during and after construction.

Proper drainage of construction areas should be provided to protect the subgrades from the detrimental effects of weather conditions. Excavations should be made with as few passes of the backhoe bucket as possible to reduce disturbance of the subgrade. A backhoe bucket fitted with a smooth blade should be used during the final subgrade preparation, where necessary. The exposed base should be kept free of standing water at all times. The site should be graded to carry any surface runoff away from the work areas. Construction traffic should be controlled to prevent excessive stresses and disturbance to the subgrade.

If pavements are not constructed immediately after grading, the subgrade should be shaped so as to prevent water ponding. If there is a substantial lapse in time between grading and paving, or if the subgrade is disturbed, it should be proof-rolled with a loaded, tandem-wheeled dump truck. Soft spots observed during proof-rolling or initial construction should be removed and replaced with compacted granular fill.

Within the proposed paved areas, and extending a distance of five feet beyond the edge on all sides, excavate existing granular fill soils to a depth of two feet below existing site grades. It may be possible to reuse the existing granular fill, depending on the suitability of the material, as described herein.

Fill Placement and Compaction

Fill materials most likely will be obtained by importing granular fill materials from off-site borrow sources. However, it may be possible to reuse existing site granular fill material provided that it can be properly placed and compacted. The gradation shall be in accordance with MBTA Standard Specification Section 02200-Earthwork for Type B Gravel Borrow.

All structural fill should be free of organics, demolition debris or other deleterious substances. The fill material should have a plasticity index (PI) less than 4 and a liquid limit (LL) less than 10, and contain fragments less than 4 inches in maximum dimension. Each lift should be compacted to the specified density prior to placing any subsequent lift. All materials to be used as structural fill should be tested in the laboratory to determine their project suitability and compaction characteristics.

The fill should be systematically compacted to the following percentages of the maximum dry density:

Table 3: Fill Compaction Requirements

DESCRIPTION	MINIMUM PERCENT COMPACTION (ASTM D-1557)
General Site Fills, Structural Fill (Below Footings and Slabs)	95
Behind Retaining Walls	92
Landscape Area	90

Soils which exhibit a well-defined moisture content–dry density relationship should be compacted to within plus or minus two percentage points of the optimum moisture content as determined by the Modified Proctor test (ASTM D-1557).

Where fill materials are placed against an existing embankment slope, the slope should be benched as the fill is brought up in layers. Benching should be of a sufficient width to permit placing and compaction of fill material upon the existing embankment materials. Typically, benches are between four to eight feet wide. Each bench cut should begin at the intersection of the existing embankment and the vertical side of the previous bench. Trench backfills over pipelines or utility structures should be performed so as not to adversely impact the underlying utilities. In fill areas, the backfill material, compaction method, and degree of compaction requirements should be similar to that for the fill adjacent to the trench.

Construction Dewatering

All excavations should be performed in the dry condition. Pumped water should be discharged in accordance with all federal, state and/or local regulations which may require a discharge permit and possible filtration and chemical testing of the water prior to discharge.

Permanent Slopes

Permanent slopes with loamed and seeded surfaces should not be steeper than 2-1/2 horizontal to 1 vertical (2-1/2H:1V) without slope protection to limit erosion and surficial sloughing of the slope. Additional analyses may be required to assess the stability of slopes for Pond 1 as the station design is finalized.

Excavation Slopes and Shoring

The slopes of temporary open cuts should be no steeper than 1-1/2H:1V. Open cuts should not be used below the water table because of the likelihood of soil sloughing into the excavation.

The temporary excavation support system, if needed, should be selected by the Contractor and designed by an experienced registered Professional Engineer in the Commonwealth of Massachusetts and retained by the Contractor. Where excavation sides can be sloped back, they should be performed in accordance with the Occupational Safety and Health Administration (OSHA) Construction Industry Standards.

Protection of Existing Facilities

It is recommended that a geotechnical instrumentation and monitoring program be performed during construction of the project to evaluate impacts on structures slated to remain adjacent to the station. It is recommended that the program be developed to provide data for the following considerations:

- To monitor ground movements and vibration levels during construction.
- To provide early warning of potentially adverse trends by presenting sufficient data to determine the source of unanticipated ground movements, if present.
- If necessary, to plan remedial measures to limit damage to embankments and structures and to provide early warning when alternative means of protection are necessary.
- To document impacts of construction on adjacent facilities.
- To evaluate the performance and structural integrity of the constructed facilities.

If needed, we recommend the following instrumentation program to measure:

- Ground surface settlement and lateral movement adjacent to proposed construction.
- Horizontal and vertical movement of any excavation support system, and existing structures.
- Vibrations as a result of construction activities.

Vertical and horizontal survey points should be established on the adjacent structures. The monitoring points should be surveyed prior to the start of construction and monitored during construction to detect movement.

Vibration monitoring shall be conducted within 100 feet of existing structures during construction activities.

We recommend conducting a pre-construction survey of structures and utilities within 100 feet of the site to document existing conditions prior to construction. Documentation should include photographs, video, sketches, and/or written comments.

Specific instrumentation and monitoring requirements shall be based on the proposed construction sequence, duration of construction, and performance criteria. Initial measurements should be established well in advance of construction so that baseline data can be developed. This information will be invaluable for providing early warning of adverse trends and for assessing the need for mitigating measures.

CLOSING

This report and the recommendations contained herein have been prepared for the exclusive use of MBTA and VHB and their representatives for specific application to the design and construction of the proposed Raynham Park Station in Raynham, Massachusetts.

This report was prepared in accordance with generally accepted soil and foundation engineering practices. No warranty, expressed or implied, is made. The analysis, design and recommendations submitted in this report are based in part upon the data obtained from subsurface explorations available at the time of this report. Subsurface stratification variations between borings are anticipated. The reported groundwater levels only represent the water levels at the time noted on the logs. The nature and extent of variations between these explorations may not become evident until construction. If significant variations then appear, or if there are changes in the nature, design or location of the proposed structure, it may be necessary to reevaluate the recommendations of this report.

Memorandum

APPENDIX C: GEOTECHNICAL CALCULATIONS

- Allowable Bearing Capacity and Estimated Settlement
- Seismic Site Class Evaluation

JACOBS

343 Congress Street
Boston, MA 02210
617/242-9222

CALCULATION WORKSHEET

JOB	MBTA South Coast Rail		
SUBJECT	Raynham Park Station		
CALCULATED BY	DH	**DATE**	2/20/2012
CHECKED BY	AH/PJM	**DATE**	2/29/2012

PURPOSE: Evaluate bearing resistance for platform shallow foundations.

REFERENCE: AASHTO LRFD Bridge Design Specifications, 2010

ASSUMPTIONS:

- Platform footing is 4 ft wide by 10 ft long.
- Bearing surface is compacted Gravel Borrow overlying sand or gravel.
- Footing embedment is at least 4 feet below final ground surface.
- Groundwater level is at 3 feet below surface.
- Footing eccentricity is assumed to be zero.
- Estimated soil properties (experience, geotech literature, Table 10.4.6.2.4-1):

	γ (pcf)	ϕ
Gravel Borrow:	125	34

BEARING CAPACITY FACTORS (Table 10.6.3.1.2a-1):

	ϕ	N_c	N_q	N_γ
Gravel Borrow:	34	42.2	29.4	41.1

CALCULATE EFFECTIVE FOOTING WIDTH (B'):

$e < B/4$ (Section 10.6.3.3)

where: B = footing width (ft) = 3
e = eccentricity (ft)

Assume no footing eccentricity, thus, e = 0

B' = B-2e 3

NOMINAL BEARING RESISTANCE (q_n):

$q_n = cN_{cm} + \gamma D_f N_{qm} C_{wq} + 0.5\gamma B' N_{\gamma m} C_{w\gamma}$ (Eqn. 10.6.3.1.2a-1)

where:
c = cohesion = 0
γ = total unit weight 125
D_f = depth of footing (ft) = 4 Assumed
B' = effective width of footing (ft) = 3
L = length of footing (ft) = 10
B'/L = 0.30
D_f /B' = 1.33
L/B' = 3.33
C_{wq} $C_{w\gamma}$ = groundwater correction factors (using B')
C_{wq} = 0.7 (Table 10.6.3.1.2a-2)
$C_{w\gamma}$ = 0.5 (Table 10.6.3.1.2a-2)

N_{cm} N_{qm} $N_{\gamma m}$ = bearing capacity factors

$N_{qm} = N_q s_q d_q i_q$ (Eqn. 10.6.3.1.2a-3)

s_q = 1.20 (Table 10.6.3.1.2a-3)

d_q = 1.23 (Table 10.6.3.1.2a-4)

i_q = 1.0 (see AASHTO p. 10-62)

N_{qm} = 43.5

$N_{\gamma m} = N_\gamma s_\gamma i_\gamma$

s_γ = 0.88 (Table 10.6.3.1.2a-3)

i_γ = 1 (see AASHTO p. 10-62)

$N_{\gamma m}$ = 36.2

JACOBS
343 Congress Street
Boston, MA 02210
617/242-9222

CALCULATION WORKSHEET

JOB	MBTA South Coast Rail		
SUBJECT	Raynham Park Station		
CALCULATED BY	DH	**DATE**	2/20/2012
CHECKED BY	AH/PJM	**DATE**	2/29/2012

q_n = 18,609 psf

ALLOWABLE BEARING RESISTANCE (q_a):

$q_a = q_n/FOS$

where: FOS = factor of safety = 2.5 for sand

q_a = 7,443 psf

use

q_a =	**7.44**	**ksf**

strength limit value

Note: Based on the anticipated light loads and potentially small footing sizes, an allowable bearing capacity of 6 ksf is recommended.

Elastic Settlement Calculations:

$$S_e = \frac{(q_o\,(1-\nu^2)\sqrt{A'})}{144 E_s \beta_z}$$ eqn. 10.6.2.4.2-1

where: q_o = applied vert. stress (ksf)
ν = Poisson's Ratio
E_s = Young's Modulus (ksi)
β_z = Shape/Rigidity Factor

ν = Poisson's Ratio =	0.30	(Table C10.4.6.3-1)
E_s = Young's Modulus (ksi) =	6.00	(Table C10.4.6.3-1)
β_z = Shape/Rigidity Factor =	1.15	(Table 10.6.2.4.2-1)

where:

B' = eff. width of footing (ft) =	3	(from bearing resistance calcs)
L = length of footing (ft):	10	(from bearing resistance calcs)
A' =(B'xL) = footing area (ft^2):	30	ft^2

Settlement (S_e) for a given q_o:

q_o = applied vertical stress (ksf) = 6.00 ksf (assumed)

Se (inches) = 0.36 inches

JACOBS

Raynham Park Station Seismic Site Class Evaluation

Based on the platform boring with the deepest soil overburden and lowest average blow counts (worst case)

Boring No.	Sample No.	N Value	Di	Di/N_i	N_{bar}

	Total Depth =	100			
	Depth to Bedrock =	10	Sum	1.33	

Per 9.4.1.2.1, N_{bar} > 50, Site Class C

9.4.1.2.1 Site Class Definitions. The site shall be classified as one of the following classes:

A = Hard rock with measured shear wave velocity, $\overline{v}_s$ > 5000ft/s (1500 m/s)

B = Rock with 2500 ft/s < $\overline{v}_s$ ≤5000 ft/s (760 m/s < $\overline{v}_s$ ≤ 1500 m/s)

C = Very dense soil and soft rock with 1200 ft/s ≤ $\overline{v}_s$ ≤ 2500 ft/s (370 m/s ≤ $\overline{v}_s$ ≤ 760 m/s) or $\overline{N}$ or $\overline{N}_{ch}$ > 50 or $\overline{s}_u$ ≥ 2000 psf (100 kPa)

D = Stiff soil with 600 ft/s ≤ $\overline{v}_s$ ≤ 1200 ft/s (180 m/s ≤ $\overline{v}_s$ ≤ 370 m/s) or with 15 ≤ $\overline{N}$ or $\overline{N}_{ch}$ ≤ 50 or 1000 psf ≤ $\overline{s}_u$ ≤ 2000 psf (50 kPa ≤ $\overline{s}_u$ ≤ 100 kPa)

E = A soil profile with $\overline{v}_s$ < 600 ft/s (180 m/s) or any profile with more than 10 ft (3 m) of soft clay. Soft clay is defined as soil with *PI* > 20, *w* ≥ 40%, and s_u < 500 psf (25 kPa)

F = Soils requiring site-specific evaluations:

1. Soils vulnerable to potential failure or collapse under seismic loading such as liquefiable soils, quick and highly sensitive clays, collapsible weakly cemented soils. Potential for liquefaction shall be evaluated in accordance with 780 CMR 1804.6: *Liquefaction*.

Exception. None.

2. Peats and/or highly organic clays (*H* > 10 ft [3 m] of peat and/or highly organic clay where *H* = thickness of soil).
3. Very high plasticity clays (H > 25 ft [7.6 m] with *PI* > 75).
4. Very thick soft/medium stiff clays (H>120 ft [37 m].

Exception. None.

Approx. Project Coordinates

Lat 41.981442
Long -71.075919

Seismic Coefficients

S_S = 0.24 (Table 1604.10*)
S_1 = 0.062 (Table 1604.10*)

For Site Class C

F_A = 1.2 (See Table 9.4.1.2.4a*)
F_V = 1.7 (See Table 9.4.1.2.4b*)

Design Spectral Response Parameters

S_{MS} = Ss x F_A = 0.288
S_{M1} = S_1 x F_V = 0.105

S_{DS} = 2/3 x S_{MS} = 0.192
S_{D1} = 2/3 x S_{M1} = 0.070

Notes: * The Massachusetts State Building Code, 8th Edition (2010)

TABLE 9.4.1.2.4a VALUES OF F_a AS A FUNCTION OF SITE CLASS AND SHORT PERIOD MAXIMUM CONSIDERED EARTHQUAKE SPECTRAL ACCELERATION

Site Class	*Tabulated Maximum Considered Earthquake Spectral Response Acceleration at Short Periods*

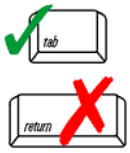
Checklist for Stormwater Report

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

A. Introduction

Important: When filling out forms on the computer, use only the tab key to move your cursor - do not use the return key.



A Stormwater Report must be submitted with the Notice of Intent permit application to document compliance with the Stormwater Management Standards. The following checklist is NOT a substitute for the Stormwater Report (which should provide more substantive and detailed information) but is offered here as a tool to help the applicant organize their Stormwater Management documentation for their Report and for the reviewer to assess this information in a consistent format. As noted in the Checklist, the Stormwater Report must contain the engineering computations and supporting information set forth in Volume 3 of the Massachusetts Stormwater Handbook. The Stormwater Report must be prepared and certified by a Registered Professional Engineer (RPE) licensed in the Commonwealth.

The Stormwater Report must include:

- The Stormwater Checklist completed and stamped by a Registered Professional Engineer (see page 2) that certifies that the Stormwater Report contains all required submittals.[1] This Checklist is to be used as the cover for the completed Stormwater Report.
- Applicant/Project Name
- Project Address
- Name of Firm and Registered Professional Engineer that prepared the Report
- Long-Term Pollution Prevention Plan required by Standards 4-6
- Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan required by Standard 8[2]
- Operation and Maintenance Plan required by Standard 9

In addition to all plans and supporting information, the Stormwater Report must include a brief narrative describing stormwater management practices, including environmentally sensitive site design and LID techniques, along with a diagram depicting runoff through the proposed BMP treatment train. Plans are required to show existing and proposed conditions, identify all wetland resource areas, NRCS soil types, critical areas, Land Uses with Higher Potential Pollutant Loads (LUHPPL), and any areas on the site where infiltration rate is greater than 2.4 inches per hour. The Plans shall identify the drainage areas for both existing and proposed conditions at a scale that enables verification of supporting calculations.

As noted in the Checklist, the Stormwater Management Report shall document compliance with each of the Stormwater Management Standards as provided in the Massachusetts Stormwater Handbook. The soils evaluation and calculations shall be done using the methodologies set forth in Volume 3 of the Massachusetts Stormwater Handbook.

To ensure that the Stormwater Report is complete, applicants are required to fill in the Stormwater Report Checklist by checking the box to indicate that the specified information has been included in the Stormwater Report. If any of the information specified in the checklist has not been submitted, the applicant must provide an explanation. The completed Stormwater Report Checklist and Certification must be submitted with the Stormwater Report.

[1] The Stormwater Report may also include the Illicit Discharge Compliance Statement required by Standard 10. If not included in the Stormwater Report, the Illicit Discharge Compliance Statement must be submitted prior to the discharge of stormwater runoff to the post-construction best management practices.

[2] For some complex projects, it may not be possible to include the Construction Period Erosion and Sedimentation Control Plan in the Stormwater Report. In that event, the issuing authority has the discretion to issue an Order of Conditions that approves the project and includes a condition requiring the proponent to submit the Construction Period Erosion and Sedimentation Control Plan before commencing any land disturbance activity on the site.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

B. Stormwater Checklist and Certification

The following checklist is intended to serve as a guide for applicants as to the elements that ordinarily need to be addressed in a complete Stormwater Report. The checklist is also intended to provide conservation commissions and other reviewing authorities with a summary of the components necessary for a comprehensive Stormwater Report that addresses the ten Stormwater Standards.

Note: Because stormwater requirements vary from project to project, it is possible that a complete Stormwater Report may not include information on some of the subjects specified in the Checklist. If it is determined that a specific item does not apply to the project under review, please note that the item is not applicable (N.A.) and provide the reasons for that determination.

A complete checklist must include the Certification set forth below signed by the Registered Professional Engineer who prepared the Stormwater Report.

Registered Professional Engineer's Certification

I have reviewed the Stormwater Report, including the soil evaluation, computations, Long-term Pollution Prevention Plan, the Construction Period Erosion and Sedimentation Control Plan (if included), the Long-term Post-Construction Operation and Maintenance Plan, the Illicit Discharge Compliance Statement (if included) and the plans showing the stormwater management system, and have determined that they have been prepared in accordance with the requirements of the Stormwater Management Standards as further elaborated by the Massachusetts Stormwater Handbook. I have also determined that the information presented in the Stormwater Checklist is accurate and that the information presented in the Stormwater Report accurately reflects conditions at the site as of the date of this permit application.

Registered Professional Engineer Block and Signature

Signature and Date

Checklist

Project Type: Is the application for new development, redevelopment, or a mix of new and redevelopment?

☐ New development

☒ Redevelopment

☐ Mix of New Development and Redevelopment

Checklist for Stormwater Report

Checklist (continued)

LID Measures: Stormwater Standards require LID measures to be considered. Document what environmentally sensitive design and LID Techniques were considered during the planning and design of the project:

☐ No disturbance to any Wetland Resource Areas

☐ Site Design Practices (e.g. clustered development, reduced frontage setbacks)

☒ Reduced Impervious Area (Redevelopment Only)

☐ Minimizing disturbance to existing trees and shrubs

☐ LID Site Design Credit Requested:

- ☐ Credit 1
- ☐ Credit 2
- ☐ Credit 3

☒ Use of "country drainage" versus curb and gutter conveyance and pipe

☒ Bioretention Cells (includes Rain Gardens)

☐ Constructed Stormwater Wetlands (includes Gravel Wetlands designs)

☐ Treebox Filter

☐ Water Quality Swale

☒ Grass Channel

☐ Green Roof

☐ Other (describe): _____

Standard 1: No New Untreated Discharges

☒ No new untreated discharges

☐ Outlets have been designed so there is no erosion or scour to wetlands and waters of the Commonwealth

☐ Supporting calculations specified in Volume 3 of the Massachusetts Stormwater Handbook included.

Checklist for Stormwater Report

Checklist (continued)

Standard 2: Peak Rate Attenuation

☐ Standard 2 waiver requested because the project is located in land subject to coastal storm flowage and stormwater discharge is to a wetland subject to coastal flooding.

☐ Evaluation provided to determine whether off-site flooding increases during the 100-year 24-hour storm.

☒ Calculations provided to show that post-development peak discharge rates do not exceed pre-development rates for the 2-year and 10-year 24-hour storms. If evaluation shows that off-site flooding increases during the 100-year 24-hour storm, calculations are also provided to show that post-development peak discharge rates do not exceed pre-development rates for the 100-year 24-hour storm.

Standard 3: Recharge

☐ Soil Analysis provided.

☐ Required Recharge Volume calculation provided.

☐ Required Recharge volume reduced through use of the LID site Design Credits.

☐ Sizing the infiltration, BMPs is based on the following method: Check the method used.

☒ Static ☐ Simple Dynamic ☐ Dynamic Field[1]

☒ Runoff from all impervious areas at the site discharging to the infiltration BMP.

☐ Runoff from all impervious areas at the site is *not* discharging to the infiltration BMP and calculations are provided showing that the drainage area contributing runoff to the infiltration BMPs is sufficient to generate the required recharge volume.

☐ Recharge BMPs have been sized to infiltrate the Required Recharge Volume.

☒ Recharge BMPs have been sized to infiltrate the Required Recharge Volume *only* to the maximum extent practicable for the following reason:

- ☒ Site is comprised solely of C and D soils and/or bedrock at the land surface
- ☐ M.G.L. c. 21E sites pursuant to 310 CMR 40.0000
- ☐ Solid Waste Landfill pursuant to 310 CMR 19.000
- ☐ Project is otherwise subject to Stormwater Management Standards only to the maximum extent practicable.

☒ Calculations showing that the infiltration BMPs will drain in 72 hours are provided.

☐ Property includes a M.G.L. c. 21E site or a solid waste landfill and a mounding analysis is included.

[1] 80% TSS removal is required prior to discharge to infiltration BMP if Dynamic Field method is used.

Checklist for Stormwater Report

Checklist (continued)

Standard 3: Recharge (continued)

☐ The infiltration BMP is used to attenuate peak flows during storms greater than or equal to the 10-year 24-hour storm and separation to seasonal high groundwater is less than 4 feet and a mounding analysis is provided.

☐ Documentation is provided showing that infiltration BMPs do not adversely impact nearby wetland resource areas.

Standard 4: Water Quality

The Long-Term Pollution Prevention Plan typically includes the following:

- Good housekeeping practices;
- Provisions for storing materials and waste products inside or under cover;
- Vehicle washing controls;
- Requirements for routine inspections and maintenance of stormwater BMPs;
- Spill prevention and response plans;
- Provisions for maintenance of lawns, gardens, and other landscaped areas;
- Requirements for storage and use of fertilizers, herbicides, and pesticides;
- Pet waste management provisions;
- Provisions for operation and management of septic systems;
- Provisions for solid waste management;
- Snow disposal and plowing plans relative to Wetland Resource Areas;
- Winter Road Salt and/or Sand Use and Storage restrictions;
- Street sweeping schedules;
- Provisions for prevention of illicit discharges to the stormwater management system;
- Documentation that Stormwater BMPs are designed to provide for shutdown and containment in the event of a spill or discharges to or near critical areas or from LUHPPL;
- Training for staff or personnel involved with implementing Long-Term Pollution Prevention Plan;
- List of Emergency contacts for implementing Long-Term Pollution Prevention Plan.

☐ A Long-Term Pollution Prevention Plan is attached to Stormwater Report and is included as an attachment to the Wetlands Notice of Intent.

☐ Treatment BMPs subject to the 44% TSS removal pretreatment requirement and the one inch rule for calculating the water quality volume are included, and discharge:

- ☐ is within the Zone II or Interim Wellhead Protection Area
- ☐ is near or to other critical areas
- ☐ is within soils with a rapid infiltration rate (greater than 2.4 inches per hour)
- ☐ involves runoff from land uses with higher potential pollutant loads.

☐ The Required Water Quality Volume is reduced through use of the LID site Design Credits.

☐ Calculations documenting that the treatment train meets the 80% TSS removal requirement and, if applicable, the 44% TSS removal pretreatment requirement, are provided.

Checklist for Stormwater Report

Checklist (continued)

Standard 4: Water Quality (continued)

☒ The BMP is sized (and calculations provided) based on:

- ☒ The ½" or 1" Water Quality Volume or
- ☐ The equivalent flow rate associated with the Water Quality Volume and documentation is provided showing that the BMP treats the required water quality volume.

☐ The applicant proposes to use proprietary BMPs, and documentation supporting use of proprietary BMP and proposed TSS removal rate is provided. This documentation may be in the form of the propriety BMP checklist found in Volume 2, Chapter 4 of the Massachusetts Stormwater Handbook and submitting copies of the TARP Report, STEP Report, and/or other third party studies verifying performance of the proprietary BMPs.

☐ A TMDL exists that indicates a need to reduce pollutants other than TSS and documentation showing that the BMPs selected are consistent with the TMDL is provided.

Standard 5: Land Uses With Higher Potential Pollutant Loads (LUHPPLs)

☐ The NPDES Multi-Sector General Permit covers the land use and the Stormwater Pollution Prevention Plan (SWPPP) has been included with the Stormwater Report.

☒ The NPDES Multi-Sector General Permit covers the land use and the SWPPP will be submitted ***prior to*** the discharge of stormwater to the post-construction stormwater BMPs.

☐ The NPDES Multi-Sector General Permit does ***not*** cover the land use.

☐ LUHPPLs are located at the site and industry specific source control and pollution prevention measures have been proposed to reduce or eliminate the exposure of LUHPPLs to rain, snow, snow melt and runoff, and been included in the long term Pollution Prevention Plan.

☐ All exposure has been eliminated.

☐ All exposure has ***not*** been eliminated and all BMPs selected are on MassDEP LUHPPL list.

☐ The LUHPPL has the potential to generate runoff with moderate to higher concentrations of oil and grease (e.g. all parking lots with >1000 vehicle trips per day) and the treatment train includes an oil grit separator, a filtering bioretention area, a sand filter or equivalent.

Standard 6: Critical Areas

☐ The discharge is near or to a critical area and the treatment train includes only BMPs that MassDEP has approved for stormwater discharges to or near that particular class of critical area.

☐ Critical areas and BMPs are identified in the Stormwater Report.

Checklist for Stormwater Report

Checklist (continued)

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the maximum extent practicable

☒ The project is subject to the Stormwater Management Standards only to the maximum Extent Practicable as a:

☐ Limited Project

☐ Small Residential Projects: 5-9 single family houses or 5-9 units in a multi-family development provided there is no discharge that may potentially affect a critical area.

☐ Small Residential Projects: 2-4 single family houses or 2-4 units in a multi-family development with a discharge to a critical area

☐ Marina and/or boatyard provided the hull painting, service and maintenance areas are protected from exposure to rain, snow, snow melt and runoff

☐ Bike Path and/or Foot Path

☒ Redevelopment Project

☐ Redevelopment portion of mix of new and redevelopment.

☐ Certain standards are not fully met (Standard No. 1, 8, 9, and 10 must always be fully met) and an explanation of why these standards are not met is contained in the Stormwater Report.

☐ The project involves redevelopment and a description of all measures that have been taken to improve existing conditions is provided in the Stormwater Report. The redevelopment checklist found in Volume 2 Chapter 3 of the Massachusetts Stormwater Handbook may be used to document that the proposed stormwater management system (a) complies with Standards 2, 3 and the pretreatment and structural BMP requirements of Standards 4-6 to the maximum extent practicable and (b) improves existing conditions.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control

A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan must include the following information:

- Narrative;
- Construction Period Operation and Maintenance Plan;
- Names of Persons or Entity Responsible for Plan Compliance;
- Construction Period Pollution Prevention Measures;
- Erosion and Sedimentation Control Plan Drawings;
- Detail drawings and specifications for erosion control BMPs, including sizing calculations;
- Vegetation Planning;
- Site Development Plan;
- Construction Sequencing Plan;
- Sequencing of Erosion and Sedimentation Controls;
- Operation and Maintenance of Erosion and Sedimentation Controls;
- Inspection Schedule;
- Maintenance Schedule;
- Inspection and Maintenance Log Form.

☒ A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan containing the information set forth above has been included in the Stormwater Report.

Checklist for Stormwater Report

Checklist (continued)

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control (continued)

☐ The project is highly complex and information is included in the Stormwater Report that explains why it is not possible to submit the Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan with the application. A Construction Period Pollution Prevention and Erosion and Sedimentation Control has ***not*** been included in the Stormwater Report but will be submitted ***before*** land disturbance begins.

☐ The project is ***not*** covered by a NPDES Construction General Permit.

☐ The project is covered by a NPDES Construction General Permit and a copy of the SWPPP is in the Stormwater Report.

☒ The project is covered by a NPDES Construction General Permit but no SWPPP been submitted. The SWPPP will be submitted BEFORE land disturbance begins.

Standard 9: Operation and Maintenance Plan

☒ The Post Construction Operation and Maintenance Plan is included in the Stormwater Report and includes the following information:

- ☐ Name of the stormwater management system owners;
- ☐ Party responsible for operation and maintenance;
- ☐ Schedule for implementation of routine and non-routine maintenance tasks;
- ☐ Plan showing the location of all stormwater BMPs maintenance access areas;
- ☐ Description and delineation of public safety features;
- ☐ Estimated operation and maintenance budget; and
- ☐ Operation and Maintenance Log Form.

☐ The responsible party is ***not*** the owner of the parcel where the BMP is located and the Stormwater Report includes the following submissions:

- ☐ A copy of the legal instrument (deed, homeowner's association, utility trust or other legal entity) that establishes the terms of and legal responsibility for the operation and maintenance of the project site stormwater BMPs;
- ☐ A plan and easement deed that allows site access for the legal entity to operate and maintain BMP functions.

Standard 10: Prohibition of Illicit Discharges

☒ The Long-Term Pollution Prevention Plan includes measures to prevent illicit discharges;

☐ An Illicit Discharge Compliance Statement is attached;

☐ NO Illicit Discharge Compliance Statement is attached but will be submitted ***prior to*** the discharge of any stormwater to post-construction BMPs.

Stormwater Report Narrative

This Stormwater Report has been prepared to demonstrate compliance with the Massachusetts Stormwater Management Standards in accordance with the Massachusetts Wetlands Protection Act Regulations (310 CMR 10.00) and Water Quality Certification Regulations (314 CMR 9.00).

Project Description

The Applicant, MassDOT, is proposing to construct a train station in Taunton, Massachusetts near the intersection of Arlington Street and the Belmont Street Extension (the Project). As proposed, the Project consists of a parking lot with 210 spaces, access driveway, a bus drop off area, a side platform, sidewalks, stairs and ramps associated with access from the parking lot to the train platform, bicycle parking facilities, a bioretention basin, and ancillary landscape improvements including the removal of the existing concrete building pads and existing broken pavement.

The site is not considered a Land Use with Higher Potential Pollutant Loads (LUHPPL) as defined in 3.10 CMR 10.04 and 314 CMR 9.02 because it is not a parking lot with a high-intensity use (1,000 vehicle trips per day or more).

Site Description

The Project Site is a 12 acre parcel of land (the Site) located at the intersection of Arlington and the Belmont Street Extension in Taunton, Massachusetts. The Site lies within the surface watershed of Taunton River and is bounded by undeveloped land to the north, by Arlington Street to the south, a large wetland to the west, and the MBTA railroad ROW to the east (see Figure 1, Site Locus Map and Figure 2, Site Aerial). The site is previously developed, however the existing buildings have burned down, leaving only building foundations and paved driveways. Stormwater runoff currently sheet flows untreated, to the existing wetland.

One wetland Resource Area on the Site, shown on Figures 3 and 4, is described in Table 1. For additional information regarding the wetland resource area T41 present on the site see the Abbreviated Notice of Resource Area Delineation (ANRAD) prepared by VHB dated May 2011.

Table 1
Wetland Resource Areas

Name	*Critical Area*	*Zone 1 or Zone A*	*ORW or SRW*	*Zone II or IWPA*	*Description*
Wetland T41	No	No	No	No	PFO

Notes: Wetland Classifications: PFO = Palustrine Forested

According to the National Resources Conservation Service (NRCS), surface soils on the Site are classified as Urban land. On-site soils are classified as fill. Based on the soil evaluation performed by Jacobs Engineering, included in Appendix C, the Site is not considered to be within an area of rapid infiltration (soils with a saturated hydraulic conductivity greater than 2.4 inches per hour). Soil vary at the upper fill levels and are poor (silty/clay), HSG D soils at levels just below the surface.

The project is located within an area of 0.2% chance of flood as shown on the FEMA Floodway Map, Town of Taunton, Massachusetts Bristol County, Community Panel Number 25005C0162F and 25005CO164F dated July 7, 2009. These maps are included in Appendix B.

Existing Drainage Conditions

Under existing conditions, the 12 acre Site is developed with predominantly impervious surfaces with small areas of intermixed pervious ground, and generally has a flat topography with 8.7 acres developed area, and the remainder generally the wetland area to the west. This drainage area is described below.

Drainage Area 1 - This 8.7-acre developed area of the site consist of concrete building foundations, paved driveways and parking areas, and small and large patches of pervious surfaces. This entire area sheet flows, untreated, to wetland T41 west of the site.

Figure 3 illustrates the existing drainage patterns on the Site. The Site was evaluated as a single drainage area because stormwater runoff flows to one Design Point. Table 2 below provides a summary of the existing conditions hydrologic data.

Table 2
Existing Conditions Hydrologic Data

Drainage Area	*Discharge Location*	*Design Point*	*Area (acres)*	*Curve Number*	*Time of Concentration (min)*
1	Wetland T41	1	8.7	93	16.1

Proposed Drainage Conditions

Figure 4 illustrates the proposed "post construction" drainage conditions for the project. As shown, the Site would be divided into three sub-drainage areas that will discharge treated stormwater to the one existing Design Point. Existing grading and drainage patterns were maintained to the maximum extent possible in the proposed conditions. The existing building foundations and broken paved areas would be removed in the proposed conditions, and replaced with landscaping, or paved parking areas as shown on Figure 4. All runoff from impervious surfaces would sheet flow to a grassed swale and then be conveyed to a bioretention area for further treatment. Low impact development stormwater management techniques have been incorporated into the design. These practices are focused on decentralizing stormwater management techniques into the design that will reduce peak runoff rates, maximize groundwater recharge and treat for water quality. The following is a summary of each drainage area.

Drainage Area 1 – This 3.0-acre area consists of almost entirely pervious area that would sheet flow to Wetland T41. The existing building foundations and paved areas would be completely removed in the proposed conditions.

Drainage Area 2 – This 4.1-acre area consists of both paved parking and drive aisle areas and landscaped islands. This area would sheet flow from the impervious surfaces into a grassed channel or a sediment forebay and then be conveyed to a bioretention area for treatment before it overflows to Wetland T41.

Drainage Area 3 – This 1.8-acre area consist of almost entirely pervious surfaces that would sheet flow onto Arlington Street, as it does under existing conditions, before it is captured by a catch basin located in the street and connected to an existing culvert.

Table 3 below provides a summary of the proposed conditions hydrologic data.

Table 3
Proposed Conditions Hydrologic Data

Drainage Area	*Discharge Location*	*Design Point*	*Area (acres)*	*Curve Number*	*Time of Concentration (min)*
1	Wetland T41	1	3.03	84	12.8
2	Wetland T41	1	4.05	93	13.3
3	Wetland T41	1	1.83	85	5.6

The site has been designed with a comprehensive stormwater management system that has been developed in accordance with the Massachusetts Stormwater Handbook. The proposed stormwater management system has been designed to treat the 0.5 inch Water Quality Volume.

Environmentally Sensitive and Low Impact Development (LID) Techniques

Low Impact Development (LID) techniques and stormwater Best Management Practices (BMPs) implemented into the site design include:

- Reduction in impervious area of 2.9 acres
- Grassed swale
- Bioretention basin
- Light colored pavement sidewalks

In general, stormwater from the proposed impervious surfaces will sheet flow into a grassed swale and conveyed to a large bioretention area for treatment and discharge to Wetland T41. Under existing conditions stormwater sheet flows from impervious surfaces, untreated, to the wetland.

Regulatory Compliance

Massachusetts Department of Environmental Protection (DEP) - Stormwater Management Standards

As demonstrated below, the proposed Project fully complies with the DEP Stormwater Management Standards at 310 CMR 10.05.

Standard 1: No New Untreated Discharges or Erosion to Wetlands

The Project has been designed to fully comply with Standard 1.

The Best Management Practices (BMPs) included in the proposed stormwater management system have been designed in accordance with the Massachusetts Stormwater Handbook. Supporting information and computations demonstrating that no new untreated discharges will result from the Project are presented through compliance with Standards 4 through 6.

All proposed Project stormwater outlets and conveyances have been designed to not cause erosion or scour to wetlands or receiving waters. Outlets from closed drainage systems have been designed with flared end sections and stone protection to dissipate discharge velocities. Overflows from BMPs that impound stormwater have been designed with stone rip rap to protect down-gradient areas from erosion.

Computations and supporting information for the sizing and selection of materials used to protect from scour and erosion are included in Appendix A.

Standard 2: Peak Rate Attenuation

The Project has been designed to fully comply with Standard 2.

The rainfall-runoff response of the Site under existing and proposed conditions was analyzed for storm events with recurrence intervals of 2, 10, and 100-years. The results of the analysis, as summarized in Table 4 below, indicate that there is no increase in peak discharge rates between the existing and proposed conditions.

Computations and supporting information regarding the hydrologic modeling are included in Appendix B.

Table 4
Peak Discharge Rates (cfs*)

Design Point	*2-year*	*10-year*	*100-year*
Design Point: Wetland T41			
Existing	19.1	28.4	42.8
Proposed	13.9	23.0	37.1

Standard 3: Stormwater Recharge

Due to the fact that the development portion of the site is comprised of fill, underlain by poorly draining soils, the project has been designed to promote infiltration of the required recharge volume only to the maximum extent practicable. The addition of pervious area in the proposed conditions will reduce runoff from the site as a whole. Currently the site runs off to the adjacent wetland and groundwater recharge is insignificant under existing conditions. If assuming there could be some infiltration, in the HSG D lower soils, according to the Stormwater Handbook, the Required Recharge Volume for the Project would be 970 cubic feet, a relatively small amount. . Approximately 1,263 cubic feet of recharge is provided in the bioretention area.

This volume of storage has been provided through the use of a bioretention basin, which has been sized using the static method. It is hoped that the bioretention basin will promote some recharge and infiltrate, however it has been designed to drain completely within 72 hours by the incorporation of perforated underdrain. This is necessary due to the inconsistent and poor draining qualities of the subsurface soil conditions. A Geotechnical Report that describes subsurface soil conditions is included as an appendix to this report.

Standard 4: Water Quality

The Project has been designed to fully comply with Standard 4.

The proposed stormwater management system implements a treatment train of BMPs that has been designed to provide a minimum of 80% TSS removal for stormwater runoff from all proposed impervious surfaces.

Computations and supporting information are included in Appendix D.

Standard 5: Land Uses with Higher Potential Pollutant Loads (LUHPPLs)

The site is not considered a LUHPPL as defined in 310 CMR 10.04 and 314 CMR 9.02 because it is not parking lot with a high-intensity use (1,000 vehicle trips per day or more).

Standard 6: Critical Areas

The Project will not discharge stormwater near or to a critical area.

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the Maximum Extent Practicable

The Project is a redevelopment, but has still been designed to fully comply with all ten of the Stormwater Management Standards.

Refer directly to each Standard for applicable computations and supporting information demonstrating compliance with each.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Controls

The Project would disturb approximately 8.9 acres of land and is therefore required to obtain coverage under the Environmental Protection Agency (EPA) National Pollutant Discharge Elimination System (NPDES) Construction General Permit (CGP). As required under this permit, a Stormwater Pollution Prevention Plan (SWPPP) would be developed and a Notice of Intent for the CGP would be submitted at least 14 days before land disturbance begins. Recommended construction period pollution prevention and erosion and sedimentation controls were discussed in the DEIR/S. Appropriate controls will be prepared and implemented by the contractor and MassDOT (MBTA) during construction in accordance with the final design and NPDES SWPPP.

Standard 9: Operation and Maintenance Plan

In compliance with Standard 9, a Post Construction Stormwater Operation and Maintenance (O&M) Plan will be developed by the MBTA during final design for the Project.

Standard 10: Prohibition of Illicit Discharges

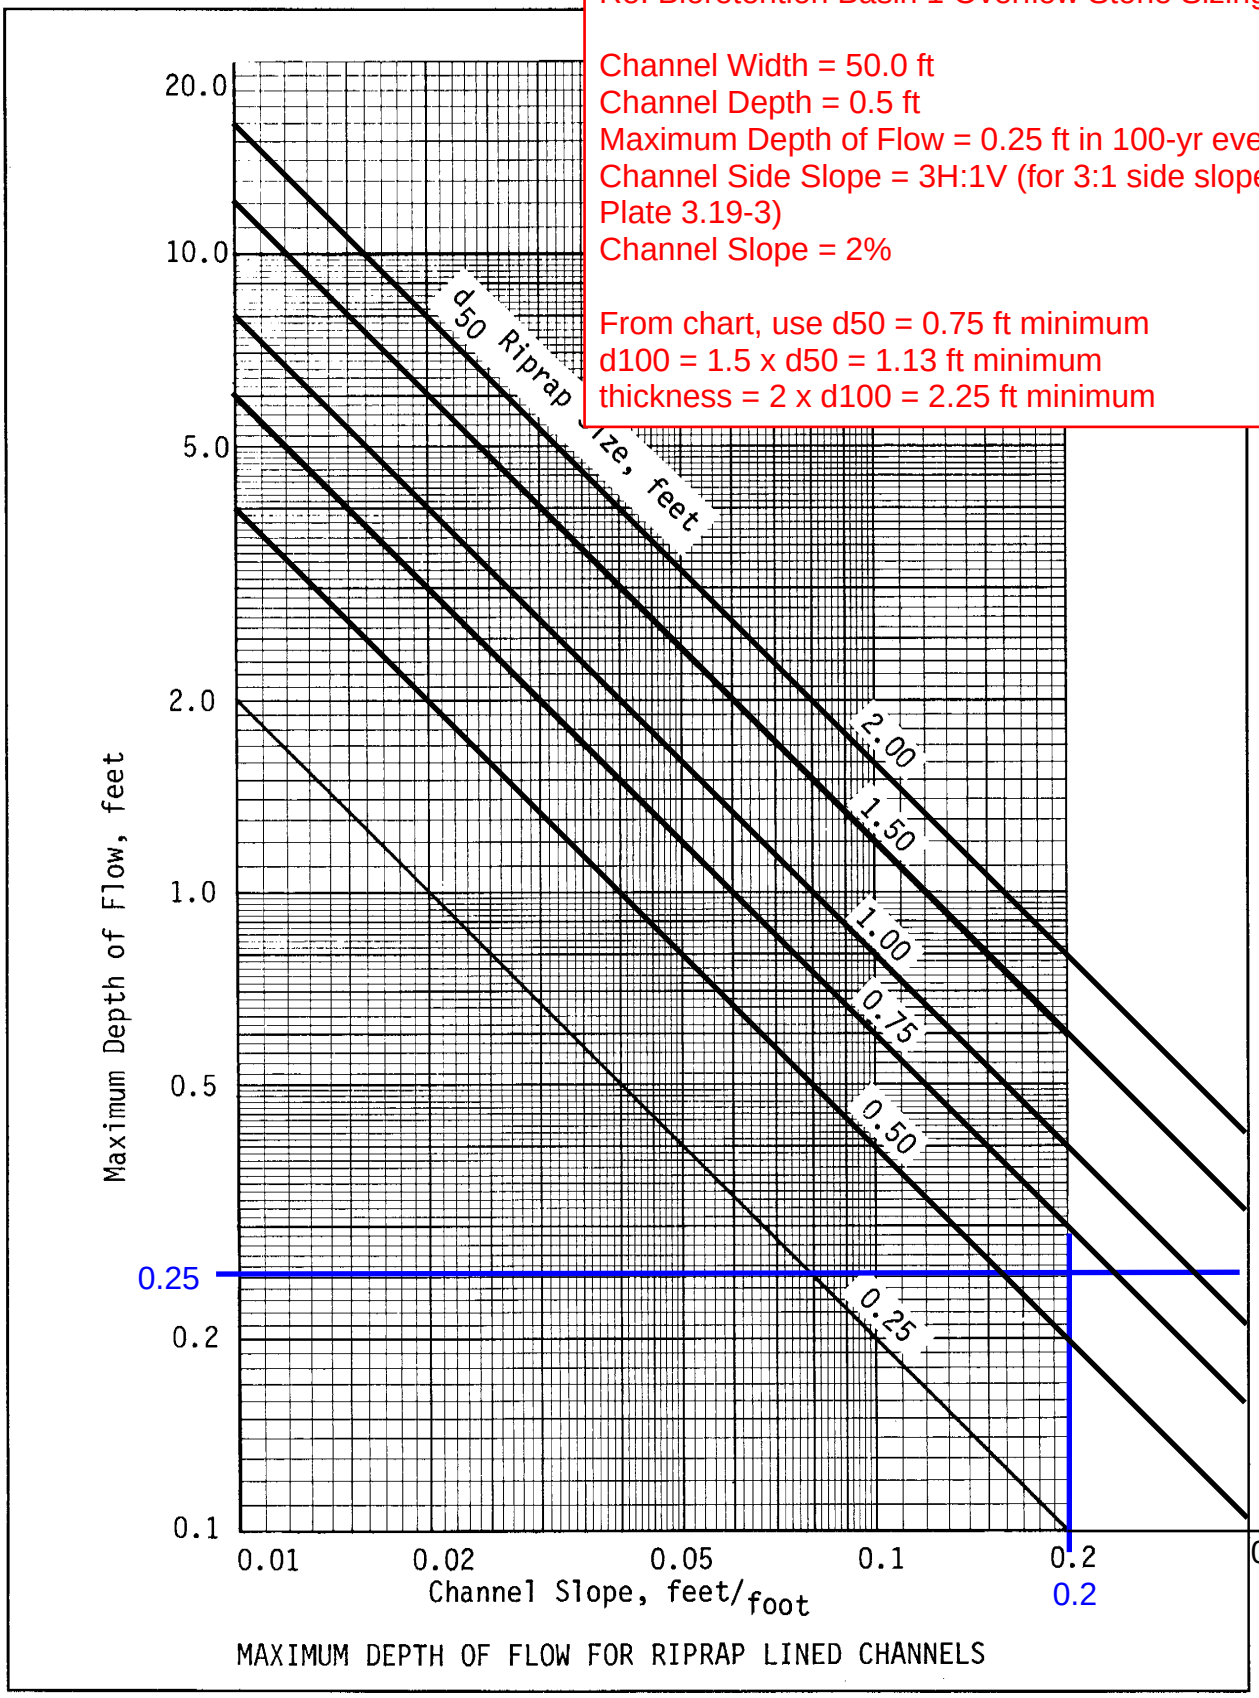
Storm drainage structures remaining from the previous development which are part of the redevelopment area will be removed. The design plans submitted with this report have been designed so that the components included therein are in full compliance with current standards. No statement is made with regard to the drainage system in portions of the site not included in the redevelopment project area. The Long-Term Pollution Prevention Plan will include measures to prevent illicit discharges.

Appendix A
Standard 1 Computations and Supporting Information

Project No: 10111 Project Name: SCR
Date: April 2012 Location: Taunton, MA
Calculated By: DAG
Re: Bioretention Basin 1 Overflow Stone Sizing

Channel Width = 50.0 ft
Channel Depth = 0.5 ft
Maximum Depth of Flow = 0.25 ft in 100-yr event
Channel Side Slope = 3H:1V (for 3:1 side slope, use Plate 3.19-3)
Channel Slope = 2%

From chart, use d50 = 0.75 ft minimum
d100 = 1.5 x d50 = 1.13 ft minimum
thickness = 2 x d100 = 2.25 ft minimum



Source: VDOT Drainage Manual Plate 3.19-3

*Sizing calculations represent minimum stone size. Larger stone may be required per detail plans.

Appendix B
Standard 2 Computations and Supporting Information

Rainfall volumes used for this analysis were based on the Natural Resources Conservation Service (NRCS) Type III, 24-hour storm event for Bristol County. Runoff coefficients for the existing and proposed conditions, as previously shown in Tables 1 and 2 respectively, were determined using NRCS Technical Release 55 (TR-55) methodology as provided in HydroCAD. The HydroCAD model is based on the NRCS Technical Release 20 (TR-20) Model for Project Formulation Hydrology.

LEGEND

SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

	1% annual chance floodplain boundary
	0.2% annual chance floodplain boundary
	Floodway boundary
	Zone D boundary
	CBRS and OPA boundary
	Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.
513	Base Flood Elevation line and value; elevation in feet*
(EL 987)	Base Flood Elevation value where uniform within zone; elevation in feet*

MAP INFORMATION

Map Scale: 1:4,250 if printed on A size (8.5" × 11") sheet.

The soil surveys that comprise your AOI were mapped at 1:20,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for accurate map measurements.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Geotechnical Report

JACOBS™
343 Congress Street
Boston, MA 02210

Design Memorandum

Date	February 17, 2012
To	Rick Carey, Natasha Velickovic - VHB
From	Paul Murphy, Da Ha, Peter Chou - Jacobs
Subject	MBTA South Coast Rail (New Bedford/Fall River Commuter Rail Extension) Taunton Station Geotechnical Design Memorandum Taunton, MA
Project No.	E2347101

INTRODUCTION

The South Coast Rail project will restore passenger rail transportation from South Station in Boston to the cities of Fall River and New Bedford along an existing rail freight corridor running south from Taunton to Fall River and New Bedford. The project will include the construction of several existing and new passenger stations and two terminal layover facilities. This geotechnical design memorandum presents the foundation design considerations for the new station platform at the proposed Taunton Station in Taunton, Massachusetts. The design recommendations presented in this report are based on the results of subsurface investigation performed by Jacobs in 2010.

Existing Conditions

The proposed Taunton Station, located off Arlington Street, is an approximately 3.8 acre site to the east of downtown Taunton (Figure 1). The site is a formerly developed parcel now containing vacant buildings and other derelict areas as a result of fire. Existing grades at the platform location range from approximately elevations 16 to 19 feet (NGVD29 Datum), generally sloping downward from north to south. A 20-inch diameter water main pipe is located along the proposed platform alignment and will need to be relocated. The remains of the buildings and their foundations will also have to be removed.

Proposed Construction

Current station plans are to construct an 800 foot long, 12 foot wide high level platform adjacent to the existing tracks, a new parking area and a new drop-off area. In addition, some track relocation is required. Access to the platform will be from a ramp/stair structure along the west side of the planned platform. Two 50-ft long platform canopies are also planned. The details of new track layout (including grading), associated sidewalks, ramps of the proposed station are still under development at the time of this report preparation. However, we anticipate that about 3 to 5 feet of fill will be placed at the site to raise the grade at the track level and platform area. This report focuses on the geotechnical design and recommendation for the platform only.

SCOPE OF WORK

This memorandum was prepared by Jacobs in accordance with the scope of work under the contract between Jacobs and VHB for work on the New Bedford/Fall River Commuter Rail Line Extension Project for Massachusetts Bay Transportation Authority (MBTA). The geotechnical work included the following tasks:

- Perform a geotechnical exploration and laboratory testing program;
- Report and interpret the results of the exploration and laboratory testing program; and
- Provide geotechnical recommendations for design and construction of the platform foundations.

The Jacobs scope of work did not include environmental assessment of the potential presence of any hazardous materials at the project site. However, please note that potential contamination was observed in borings TS-5 (samples S2 and S3) from a depth of about 3 to 10 feet and TS-19 (samples S2 and S3) from a depth of about 3 to 10 feet (refer to boring logs in Appendix A).

LOCAL GEOLOGY

The site is located in the Narragansett Basin of southeastern Massachusetts. The rocks in the Narragansett Basin consist mostly of lightly metamorphosed shale and sandstone of Pennsylvanian and Permian age. The Taunton Station is located in the area of the Rhode Island Formation. The rocks encountered in the borings included coarse, weathered sandstone, dark gray shale, and dark gray siltstone. The weathered sandstone was sampled by Standard Penetration Tests with high blow counts. The shale and siltstone were cored but only partially recovered due to weathered seams. The rock contains joints oriented parallel to bedding, which typically dipped about 30 degrees. Based on the borings, the top of rock is likely to be between elevation -12 feet and elevation -30 feet over the site.

GEOTECHNICAL EXPLORATIONS

Jacobs planned the subsurface exploration program and retained the drilling contractor to perform the exploration. The geotechnical data report was submitted in 2010. Five borings (TS-1 to TS-5) were conducted along the proposed station platform and fourteen borings (TS-7, TS-9, TS-11, TS-13, TS-15, TS-17, and TS-19 to TS-26) were drilled in the general vicinity of the proposed parking lot and the access roads. Boring locations are shown on the Subsurface Exploration Plan (Figure 2).

The borings were drilled by New Hampshire Boring using either a CME-550 or D-50 ATV mounted drill rig, or a CME-75 truck mounted drill rig. The borings were advanced through the soil by wash boring methods using a 4-inch casing and roller bit with water. Standard penetration tests (SPT), consisting of a 140-pound hammer dropping 30 inches on a standard 2-inch-diameter (OD) split-spoon sampler, were performed with a safety hammer or an automatic hammer to establish the consistency of the subsurface soils. The SPT's were typically performed at five foot intervals of depth. The obtained samples were sealed in glass jars to retain their natural moisture. Bedrock was encountered and cored in some of the borings around the proposed platform area.

The borings were observed by a representative from Jacobs. The soil samples were classified in the field in accordance with ASTM D2488, Standard Practice for Description and Identification of Soils (Visual-Manual Procedure) by Jacobs' representative, and appropriate stratum breaks were interpolated from drilling and sampling observations. The boring logs were prepared by Jacobs based on the field classifications and laboratory testing, and are presented in Appendix A.

LABORATORY TESTING

The results of the laboratory testing were previously submitted to VHB in report entitled "South Coast Rail, Jacobs Geotechnical Data Report", dated November 2010.

Grain size distribution analyses were performed to evaluate the gradation of the natural granular soils for potential reuse as backfill, if needed, and to classify the soils. The graduation analyses are summarized in Table 1 below and are presented in Appendix B.

Table 1: Laboratory Soil Classification Summary

BORING NO.	SAMPLE NO.	ELEVATION (FEET)	USCS SOIL CLASSIFICATION	W (%)	ATTERBERG LIMITS		GRAVEL (%)	SAND (%)	FINES (%)	ORGANIC CONTENT (%)
					LL	PI				
TS-2	S3	9.0	Clay (CL)	32	NT	NT	NT	NT	NT	NT
	S4	4.0	Silt (ML)	37	26	4	0	1.1	98.9	NT
TS-3	S3	8.0	Clay (CL)	38	NT	NT	NT	NT	NT	NT
TS-7	S3	8.0	Clay (CL)	37	32	11	0	6.1	93.9	NT
	S4	3.0	Clay (CL)	33	NT	NT	NT	NT	NT	NT
TS-11	S2	14.0	Silt (ML)	26	NT	NT	NT	NT	NT	7.8
TS-20	S3	6.0	Silt (ML)	41	33	9	0	5.6	94.4	NT
TS-24	S3	6.0	Clay (CL)	32	NT	NT	NT	NT	NT	NT

Where: w = natural moisture content, LL = Liquid Limit, PI = Plasticity Index, NT = Not Tested

SUBSURFACE CONDITIONS

The subsurface conditions at the site were inferred from the boring data collected for the South Coast Rail project, with some interpretations. The subsurface conditions encountered at the station platform generally consist of a layer of granular fill of up to 4-feet thickness, underlain by an intermittent sand layer, and a clayey silt layer with thickness ranging from about 20 feet to 30 feet overlying glacial till and weathered bedrock. A 5 to 10 feet thick lean clay layer was encountered within the clayey silt layer in borings TS-2 and TS-3. Weathered bedrock was encountered at a depth of about 28 to 38 feet in the platform area, corresponding to approximately elevations -12 to -21 feet.

Fill materials with thicknesses varying from 0.3 to 7 feet were also encountered in the vicinity of the proposed parking lot area. Bedrock was not encountered in this area due to shallow boring depths.

Subsurface soil conditions are summarized in Table 2 and discussed below.

Table 2: Summary of Subsurface Conditions at Borings

BORING NUMBER	GROUND SURFACE ELEV. (FT)	APPROX. FILL THICKNESS (FT)	TOP OF NATURAL SOIL ELEV. (FT)	APPROX. TOP OF ROCK ELEV. (FT)	BOTTOM OF BORING ELEV. (FT)	APPROX. GROUND WATER ELEV. (FT)	REMARKS

TS-26	14.0	1	13.0	NE	-11.0	12.0	Boring offset ~10 ft E

NE: Not encountered at the boring during drilling.

Soil conditions in the platform area generally consisted of the following:

Fill: The fill layer typically consists of mostly granular, loose to medium dense sand with up to about 15% silt and 15% gravel. The fill layer is generally about 3 to 4 feet thick in the area of the platform.

Sand: Below the fill, an intermittent sand layer consisting of predominantly fine sand with up to about 40% silt was encountered. These deposits are medium dense with Standard Penetration Test (SPT) N-values ranging between 11 and 23 blows per foot (bpf).

Clayey Silt: The clayey silt layer generally consists of silt with up to about 20% clay. This layer is typically soft to very stiff with SPT N-value ranging between 2 and 26 bpf.

An approximately 5 to 10 feet thick medium stiff to stiff lean clay layer was encountered in borings TS-2 and TS-3 from about 8 to 19 feet below ground surface, corresponding to elevations 10 to -2 feet.

Glacial Till: A thin layer of medium dense to dense glacial till was encountered in borings TS-3 and TS-5 overlying weathered bedrock.

Weathered Bedrock: Weathered bedrock was encountered in the platform area at depth of about 28 to 38 feet below existing ground surface, corresponding to approximately elevations -12 to -21 feet. The bedrock was generally weathered shale or slightly weathered soft siltstone.

Groundwater: Groundwater levels were measured in the test borings using a weighted tape during and at completion of drilling. The data indicated the groundwater level ranged from approximate elevations 16 to 19 feet along the platform alignment, and from elevations 13 to 18 feet in the general area of the proposed parking lot. The use of wash boring techniques for all soil borings may have artificially increased the water level readings due to the addition of water to the borings. Trapped/perched water is also commonly seen at a higher elevation within existing fill and silty materials. The longer term water level readings taken at Boring TS–05 OW on July 7, 2010 and September 12, 2011 indicated the water at a depth of about 22.5 feet (Elevation -6.5 feet) and 11.3 feet (Elevation 4.7 feet). The longer term water level readings taken at Boring TS–20 OW on July 7, 2010 and September 12, 2011 indicated the water at a depth of about 5.5 feet (Elevation 8.5 feet) and 2.0 feet (Elevation 12.0 feet). Based upon these short-term observations and readings from the observation wells, it is anticipated that the groundwater could be at approximately elevation 10 to 12 feet at the site.

Groundwater levels should be expected to fluctuate with rainfall and other seasonal variations. More long-term observations would be required to evaluate true groundwater levels and their influence on planned construction. Local and periodic variations of ground water elevations may also be influenced by local subsurface drainage, leaking water or sewer pipes, and precipitation.

GEOTECHNICAL RECOMMENDATIONS

Based on our review of available subsurface conditions, the proposed station platforms can be supported on shallow spread footings bearing directly on competent natural soil or structural fill placed above suitable natural soils. Platform and canopy design loads were not available at the time of this report preparation. However, it is anticipated that the station platform will be lightly (axially) loaded with limited horizontal forces from wind and seismic loads.

The following paragraphs provide project specific geotechnical recommendations for foundation soil preparation, structural fill/backfill placement, and design and construction of platform foundations.

Platform Foundations

Spread footings are recommended for the platform foundations, bearing on compacted structural fill or natural granular deposits. The bottom of footing elevation should be at least 4 feet below final grades for frost protection. Due to proposed site filling, bottom of footing is anticipated to be at approximately elevations 16 to 18 feet. The existing fill is not suitable for support of the spread footings and should be removed within the zone of influence of the footings, defined by a line extending one foot horizontally from the bottom edge of footing and then down and away at a 1H:1V slope until natural soils are encountered.

The recommended allowable design bearing capacity for spread footings bearing on at least medium dense structural fill or natural sandy soil is 3 ksf, provided that subgrades are prepared as described herein. This provides an adequate factor of safety against bearing failure and limits the total estimated settlement to about 1.5 inches due to consolidation of the underlying clayey silt layer and the differential settlement to about 3/4 inch. It is recommended that footings should be at least 7 feet wide to limit bearing pressure and settlement impacts. Due to site filling to raise the track grade, we anticipate the track and platform will settle similarly over time. However, if these estimated settlements are not acceptable, alternative means of supporting the platform, such as drilled minipiles, can be developed.

The structural fill material, if needed, should be free from organics and other deleterious substances and should conform to the requirements listed in the MBTA Standard Specification Section 02200 - Earthwork for Type B Gravel Borrow. The structural fill should be compacted to 95% of the maximum dry density as determined by the Modified Proctor compaction test (ASTM D1557).

All temporary open cuts required for footing construction should be in accordance with the related OSHA regulations and should have side slopes of no steeper than 1.5H:1V.

Seismic Consideration

The seismic design should comply with the requirements of the most current Massachusetts State Building Code 780 CMR and other relevant project design codes such as AREMA and AASHTO. Modification of the peak acceleration by the soils overlying bedrock depends upon the type of soil at the site. For the subsurface conditions encountered, the station site is classified as Seismic Site Class D soil profile in accordance with 780 CMR Chapter 1614.0 Section 9.4 Site Ground Motion. The structure could be designed for the total lateral seismic force using the equations specified in the code, or by the response spectrum method using the design spectra presented in the code. The maximum considered earthquake ground motions shall be as represented by the spectral response acceleration at short periods (Ss) and at 1-sec (S_1) obtained from Table 1604.10 of the Massachusetts State Building Code and adjusted for Site Class effects using the site coefficients of Section 9.4.1.2.4.

For Site Class D Soils at the location of this station:

$S_{MS} = 0.384$ and $S_{M1} = 0.149$

$S_{DS} = 0.256$ and $S_{D1} = 0.099$

where:

- S_{MS} is the maximum consider earthquake spectral response acceleration for short periods adjusted for site class
- S_{M1} is the maximum consider earthquake spectral response acceleration at 1-sec adjusted for site class
- S_{DS} is the design earthquake spectral response acceleration for short periods adjusted for site class
- S_{D1} is the design earthquake spectral response acceleration at 1-sec adjusted for site class

The building code also requires that the soil be evaluated for the following potential hazards: slope instability, soil liquefaction, or surface rupture due to faulting or lateral spreading. The proposed grading is relatively flat and we are not aware of any pre-existing slope instability in this area. The existing overburden soils do not appear to be subject to surface rupture due to faulting or lateral spreading.

Liquefaction

Based on the observed subsurface conditions, recorded water levels, percentage of fine contents and sample relative densities the existing soils underlying the site are judged not susceptible to liquefaction.

CONSTRUCTION CONSIDERATIONS

Foundation Installation - Spread Footings

The existing fill, as well as any former building foundations should be stripped off and removed from within the zone of influence of the platform and any walkway areas down to natural soil deposits using a smooth edge excavation bucket, and replaced by compacted granular soils.

Following excavation to the top of the natural soil deposits, the exposed surface should be observed by an on-site representative of the project geotechnical engineer and be proof-compacted with at least 10 passes of a large vibratory drum roller. Any yielding areas should be observed by geotechnical personnel to assess if localized undercutting is necessary. Footing subgrade observations should include hand auger probes by the geotechnical personnel to check for soft/weak zones. The need for undercutting and backfilling with structural fill should be closely evaluated in the field based on encountered conditions.

In areas where seepage is encountered within footing excavations, the need for placing a 3" thick lean concrete mud mat or a layer of ¾-inch crushed stone to protect the bearing surface should be evaluated in the field. Crushed stone thicker than 4 inches shall be wrapped by non-woven filter fabric.

Following observation of the bearing soils by geotechnical personnel, reinforcing steel and concrete can be placed in the excavation. It is recommended that footing reinforcing steel and concrete be placed the same day as the footing excavation is made, where possible, to avoid significant moisture content changes in the bearing soils. No water should be allowed to pond within excavations and drainage should be maintained away from foundations both during and after construction. The footing excavation should be free of loose debris at the time of footing concrete placement.

Subgrade Preparation

Prior to performing any required grading operations and excavations in the proposed structure footprints, walkway and paved areas, these areas should be stripped of topsoil, vegetation, fill, organic silt, former building foundations and existing pavement, if present. The topsoil should be placed in a designated area for reuse during final grading. Following site clearing and stripping, the exposed subgrade should be proof compacted with 10 passes of a large vibratory drum roller (minimum 10,000 pound static weight). Any pockets of excessively soft, wet or disturbed soil or unsuitable soils should be removed and replaced with properly compacted fill materials. Where subgrade soils are close to the existing groundwater level or where silty subgrade soils are encountered, proof-compaction using non-vibratory methods may be considered by the geotechnical engineer.

If additional rolling does not correct the unstable condition, the subgrade should be scarified to a depth of at least six inches but not exceeding eighteen inches, aerated, re-compacted, and retested to provide uniform compaction. Following satisfactory compaction of the subgrade, controlled compacted fill material should be placed to bring the site to the required grade.

Fill should not be placed over frozen soil. Soil subgrades should be protected against frost both during and after construction.

Proper drainage of construction areas should be provided to protect the subgrades from the detrimental effects of weather conditions. Excavations should be made with as few passes of the backhoe bucket as possible to reduce disturbance of the subgrade. A backhoe bucket fitted with a smooth blade should be used during the final subgrade preparation, where necessary. The exposed base should be kept free of standing water at all times. The site should be graded to carry any surface runoff away from the work areas. Construction traffic should be controlled to prevent excessive stresses and disturbance to the subgrade.

If pavements are not constructed immediately after grading, the subgrade should be shaped so as to prevent ponding. If there is a substantial lapse in time between grading and paving, or if the subgrade is disturbed, it should be proof-rolled with a loaded, tandem-wheeled dump truck. Soft spots observed during proof-rolling or initial construction should be removed and replaced with compacted granular fill.

Within the proposed paved areas, and extending a distance of five feet beyond the edge on all sides, excavate existing granular fill soils to a depth of two feet below existing site grades. It may be possible to reuse the existing granular fill, depending on the suitability of the material, as described herein.

Fill Placement and Compaction

Fill materials most likely will be obtained by importing granular fill materials from off-site borrow sources. However, it may be possible to reuse existing site granular fill material provided that it can be properly placed and compacted. The gradation shall be in accordance with MBTA Standard Specification Section 02200-Earthwork for Type B Gravel Borrow.

All structural fill should be free of organics, demolition debris or other deleterious substances. The fill material should have a plasticity index (PI) less than 4 and a liquid limit (LL) less than 10, and contain fragments less than 4 inches in maximum dimension. Each lift should be compacted to the specified density prior to placing any subsequent lift. All materials to be used as structural fill should be tested in the laboratory to determine their project suitability and compaction characteristics.

The fill should be systematically compacted to the following percentages of the maximum dry density:

Table 3: Fill Compaction Requirements

DESCRIPTION	MINIMUM PERCENT COMPACTION (ASTM D-1557)
General Site Fills, Structural Fill (Below Footings and Slabs)	95
Behind Retaining Walls	92
Landscape Area	90

Soils which exhibit a well-defined moisture content–dry density relationship should be compacted to within plus or minus two percentage points of the optimum moisture content as determined by the Modified Proctor test (ASTM D-1557).

Where fill materials are placed against an existing embankment slope, the slope should be benched as the fill is brought up in layers. Benching should be of a sufficient width to permit placing and compaction of fill material upon the existing embankment materials. Typically, benches are between four to eight feet wide. Each bench cut should begin at the intersection of the existing embankment and the vertical side of the previous bench. Trench backfills over pipelines or utility structures should be performed so as not to adversely impact the underlying utilities. In fill areas, the backfill material, compaction method, and degree of compaction requirements should be similar to that for the fill adjacent to the trench.

Construction Dewatering

All excavations should be performed in the dry condition. Discharge of pumped water should be performed in accordance with all federal, state and/or local regulations which may require a discharge permit and possible filtration and chemical testing of the water prior to discharge.

Permanent Slopes

Permanent slopes with loamed and seeded surfaces should not be steeper than 2-1/2 horizontal to 1 vertical (2-1/2H:1V) without slope protection to limit erosion and surficial sloughing of the slope. Additional analyses may be required to assess the stability of slopes steeper than 2-1/2H:1V as the station design is finalized.

Excavation Slopes and Shoring

The slopes of temporary open cuts should be no steeper than 1-1/2H:1V. Open cuts should not be used below the water table because of the likelihood of soil sloughing into the excavation.

The temporary excavation support system, if needed, should be selected by the Contractor and designed by an experienced Professional Engineer registered in the Commonwealth of Massachusetts and retained by the Contractor. Where excavation sides can be sloped back, they should be performed in accordance with the Occupational Safety and Health Administration (OSHA) Construction Industry Standards.

Protection of Existing Facilities

It is recommended that a geotechnical instrumentation and monitoring program be performed during construction of the project to evaluate impacts on adjacent structures. It is recommended that the program be developed to provide data for the following considerations:

- To monitor ground movements and vibration levels during construction.
- To provide early warning of potentially adverse trends by presenting sufficient data to determine the source of unanticipated ground movements, if present.
- If necessary, to plan remedial measures to limit damage to embankments and structures and to provide early warning when alternative means of protection are necessary.
- To document impacts of construction on adjacent facilities.
- To evaluate the performance and structural integrity of the constructed facilities.

We recommend the following instrumentation program to measure:

- Ground surface settlement and lateral movement adjacent to proposed construction.
- Horizontal and vertical movement of any excavation support system, and existing structures.
- Vibrations as a result of construction activities.

Vertical and horizontal survey points should be established on the adjacent structures. The monitoring points should be surveyed prior to the start of construction and monitored during construction to detect movement.

Vibration monitoring shall be conducted within 100 feet of existing structures during construction activities.

We recommend conducting a pre-construction survey of structures and utilities within 100 feet of the site to document existing conditions prior to construction. Documentation should include photographs, video, sketches, and/or written comments.

Specific instrumentation and monitoring requirements shall be based on the proposed construction sequence, duration of construction, and performance criteria. Initial measurements should be established well in advance of construction so that baseline data can be developed. This information will be invaluable for providing early warning of adverse trends and for assessing the need for mitigating measures.

CLOSING

This report and the recommendations contained herein have been prepared for the exclusive use of MBTA and VHB and their representatives for specific application to the design and construction of the proposed Taunton Station in Taunton, Massachusetts.

This report was prepared in accordance with generally accepted soil and foundation engineering practices. No warranty, expressed or implied, is made. The analysis, design and recommendations submitted in this report are based in part upon the data obtained from subsurface explorations available at the time of this report. Subsurface stratification variations between borings are anticipated. The reported groundwater levels only represent the water levels at the time noted on the logs. The nature and extent of variations between these explorations may not become evident until construction. If significant variations then appear, or if there are changes in the nature, design or location of the proposed structure, it may be necessary to reevaluate the recommendations of this report.

APPENDIX C: GEOTECHNICAL CALCULATIONS

- Allowable Bearing Capacity and Estimated Settlement
- Seismic Site Class Evaluation

JACOBS

343 Congress Street
Boston, MA 02210
617/242-9222

JOB	MBTA South Coast Rail		
SUBJECT	Taunton Station		
CALCULATED BY	DH	**DATE**	2/10/2012
CHECKED BY	AH/PJM	**DATE**	2/14/2012

PURPOSE: Evaluate bearing resistance for platform shallow foundations.

REFERENCE: AASHTO LRFD Bridge Design Specifications, 2010

ASSUMPTIONS:
- Platform footing is 7 ft wide by 10 ft long.
- Bearing surface is compacted Gravel Borrow overlying poorly graded sand (SP) or sandy silt (ML).
- Footing embedment is at least 4 feet below ground surface.
- Groundwater level is at 6 feet below surface.
- Footing eccentricity is assumed to be zero.
- Estimated soil properties (experience, geotech literature, Table 10.4.6.2.4-1):

	γ (pcf)	ϕ
Gravel Borrow:	125	34

BEARING CAPACITY FACTORS (Table 10.6.3.1.2a-1):

	ϕ	N_c	N_q	N_γ
Gravel Borrow:	34	42.2	29.4	41.1

CALCULATE EFFECTIVE FOOTING WIDTH (B'):

$e < B/4$ (Section 10.6.3.3)

where: B = footing width (ft) = 7
e = eccentricity (ft)

Assume no footing eccentricity, thus, e = 0

B' = B-2e 7

NOMINAL BEARING RESISTANCE (q_n):

$q_n = cN_{cm} + \gamma D_f N_{qm} C_{wq} + 0.5\gamma B' N_{\gamma m} C_{w\gamma}$ (Eqn. 10.6.3.1.2a-1)

where:
- c = cohesion = 0
- γ = total unit weight = 125
- D_f = depth of footing (ft) = 4 Assumed
- B' = effective width of footing (ft) = 7
- L = length of footing (ft) = 10
- B'/L = 0.70
- D_f /B' = 0.57
- C_{wq} $C_{w\gamma}$ = groundwater correction factors (using B')
- C_{wq} = 1.0 (Table 10.6.3.1.2a-2)
- $C_{w\gamma}$ = 0.6 (Table 10.6.3.1.2a-2)

N_{cm} N_{qm} $N_{\gamma m}$ = bearing capacity factors

$N_{qm} = N_q s_q d_q i_q$ (Eqn. 10.6.3.1.2a-3)

s_q = 1.47 (Table 10.6.3.1.2a-3)

d_q = 1.20 (Table 10.6.3.1.2a-4)

i_q = 1.0 (see AASHTO p. 10-62)

N_{qm} = 51.9

343 Congress Street
Boston, MA 02210
617/242-9222

JOB	MBTA South Coast Rail		
SUBJECT	Taunton Station		
CALCULATED BY	DH	DATE	2/10/2012
CHECKED BY	AH/PJM	DATE	2/14/2012

$N_{\gamma m} = N_\gamma s_\gamma i_\gamma$

s_γ = 0.72 (Table 10.6.3.1.2a-3)

i_γ = 1 (see AASHTO p. 10-62)

$N_{\gamma m}$ = 29.6

q_n = 33,737 psf

ALLOWABLE BEARING RESISTANCE (q_a):

$q_a = q_n/FOS$

where: FOS = factor of safety = 2.5 for granular soil

q_a = 13,495 psf

use

q_a = 13.49 ksf strength limit value

Note: Based on the existence of underlying clay/silt soils, an allowable bearing capacity of 3 ksf is recommended.

Elastic Settlement Calculations:

$$S_e = \frac{(q_o\,(1-\nu^2)\sqrt{A'})}{144 E_s \beta_z}$$ eqn. 10.6.2.4.2-1

where: q_o = applied vert. stress (ksf)
v = Poisson's Ratio
E_s = Young's Modulus (ksi)
β_z = Shape/Rigidity Factor

v = Poisson's Ratio =	0.30	(Table C10.4.6.3-1)
E_s = Young's Modulus (ksi) =	6.00	(Table C10.4.6.3-1)
β_z = Shape/Rigidity Factor =	1.08	(Table 10.6.2.4.2-1)

where:

B' = eff. width of footing (ft) =	7	(from bearing resistance calcs)
L = length of footing (ft):	10	(from bearing resistance calcs)
A' =(B'xL) = footing area (ft^2):	70	ft^2

Settlement (S_e) for a given q_o:

q_o = applied vertical stress (ksf) = 3.00 ksf (assumed)

Se (inches) = 0.29 inches

Long -71.080822

Seismic Coefficients

S_S = 0.24 (Table 1604.10*)
S_1 = 0.062 (Table 1604.10*)

For Site Class D

F_A = 1.6 (See Table 9.4.1.2.4a*)
F_V = 2.4 (See Table 9.4.1.2.4b*)

Design Spectral Response Parameters

$S_{MS} = Ss \times F_A$ = 0.384
$S_{M1} = S_1 \times F_V$ = 0.149

$S_{DS} = 2/3 \times S_{MS}$ = 0.256
$S_{D1} = 2/3 \times S_{M1}$ = 0.099

Per 9.4.1.2.1, $15 < N_{bar} < 50$, Site Class D

Notes: * The Massachusetts State Building Code, 8th Edition (2010)

9.4.1.2.1 Site Class Definitions. The site shall be classified as one of the following classes:

A = Hard rock with measured shear wave velocity, $\overline{v}_s$ > 5000ft/s (1500 m/s)

B = Rock with 2500 ft/s < $\overline{v}_s$ ≤5000 ft/s (760 m/s < $\overline{v}_s$ ≤ 1500 m/s)

C = Very dense soil and soft rock with 1200 ft/s ≤ $\overline{v}_s$ ≤ 2500 ft/s (370 m/s ≤ $\overline{v}_s$ ≤ 760 m/s) or $\overline{N}$ or $\overline{N}_{ch}$ > 50 or $\overline{s}_u$ ≥ 2000 psf (100 kPa)

D = Stiff soil with 600 ft/s ≤ $\overline{v}_s$ ≤ 1200 ft/s (180 m/s ≤ $\overline{v}_s$ ≤ 370 m/s) or with 15 ≤ $\overline{N}$ or $\overline{N}_{ch}$ ≤ 50 or 1000 psf ≤ $\overline{s}_u$ ≤ 2000 psf (50 kPa ≤ $\overline{s}_u$ ≤ 100 kPa)

E = A soil profile with $\overline{v}_s$ < 600 ft/s (180 m/s) or any profile with more than 10 ft (3 m) of soft clay. Soft clay is defined as soil with *PI* > 20, *w* ≥ 40%, and s_u < 500 psf (25 kPa)

F = Soils requiring site-specific evaluations:

1. Soils vulnerable to potential failure or collapse under seismic loading such as liquefiable soils, quick and highly sensitive clays, collapsible weakly cemented soils. Potential for liquefaction shall be evaluated in accordance with 780 CMR 1804.6: *Liquefaction*.

Exception. None.

2. Peats and/or highly organic clays (*H* > 10 ft [3 m] of peat and/or highly organic clay where *H* = thickness of soil).
3. Very high plasticity clays (H > 25 ft [7.6 m] with *PI* > 75).
4. Very thick soft/medium stiff clays (H>120 ft [37 m].

Exception. None.

TABLE 9.4.1.2.4a VALUES OF F_a AS A FUNCTION OF SITE CLASS AND SHORT PERIOD MAXIMUM CONSIDERED EARTHQUAKE SPECTRAL ACCELERATION

Checklist for Stormwater Report

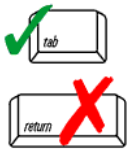
A. Introduction

Important: When filling out forms on the computer, use only the tab key to move your cursor - do not use the return key.



A Stormwater Report must be submitted with the Notice of Intent permit application to document compliance with the Stormwater Management Standards. The following checklist is NOT a substitute for the Stormwater Report (which should provide more substantive and detailed information) but is offered here as a tool to help the applicant organize their Stormwater Management documentation for their Report and for the reviewer to assess this information in a consistent format. As noted in the Checklist, the Stormwater Report must contain the engineering computations and supporting information set forth in Volume 3 of the Massachusetts Stormwater Handbook. The Stormwater Report must be prepared and certified by a Registered Professional Engineer (RPE) licensed in the Commonwealth.

The Stormwater Report must include:

- The Stormwater Checklist completed and stamped by a Registered Professional Engineer (see page 2) that certifies that the Stormwater Report contains all required submittals.[1] This Checklist is to be used as the cover for the completed Stormwater Report.
- Applicant/Project Name
- Project Address
- Name of Firm and Registered Professional Engineer that prepared the Report
- Long-Term Pollution Prevention Plan required by Standards 4-6
- Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan required by Standard 8[2]
- Operation and Maintenance Plan required by Standard 9

In addition to all plans and supporting information, the Stormwater Report must include a brief narrative describing stormwater management practices, including environmentally sensitive site design and LID techniques, along with a diagram depicting runoff through the proposed BMP treatment train. Plans are required to show existing and proposed conditions, identify all wetland resource areas, NRCS soil types, critical areas, Land Uses with Higher Potential Pollutant Loads (LUHPPL), and any areas on the site where infiltration rate is greater than 2.4 inches per hour. The Plans shall identify the drainage areas for both existing and proposed conditions at a scale that enables verification of supporting calculations.

As noted in the Checklist, the Stormwater Management Report shall document compliance with each of the Stormwater Management Standards as provided in the Massachusetts Stormwater Handbook. The soils evaluation and calculations shall be done using the methodologies set forth in Volume 3 of the Massachusetts Stormwater Handbook.

To ensure that the Stormwater Report is complete, applicants are required to fill in the Stormwater Report Checklist by checking the box to indicate that the specified information has been included in the Stormwater Report. If any of the information specified in the checklist has not been submitted, the applicant must provide an explanation. The completed Stormwater Report Checklist and Certification must be submitted with the Stormwater Report.

[1] The Stormwater Report may also include the Illicit Discharge Compliance Statement required by Standard 10. If not included in the Stormwater Report, the Illicit Discharge Compliance Statement must be submitted prior to the discharge of stormwater runoff to the post-construction best management practices.

[2] For some complex projects, it may not be possible to include the Construction Period Erosion and Sedimentation Control Plan in the Stormwater Report. In that event, the issuing authority has the discretion to issue an Order of Conditions that approves the project and includes a condition requiring the proponent to submit the Construction Period Erosion and Sedimentation Control Plan before commencing any land disturbance activity on the site.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

B. Stormwater Checklist and Certification

The following checklist is intended to serve as a guide for applicants as to the elements that ordinarily need to be addressed in a complete Stormwater Report. The checklist is also intended to provide conservation commissions and other reviewing authorities with a summary of the components necessary for a comprehensive Stormwater Report that addresses the ten Stormwater Standards.

Note: Because stormwater requirements vary from project to project, it is possible that a complete Stormwater Report may not include information on some of the subjects specified in the Checklist. If it is determined that a specific item does not apply to the project under review, please note that the item is not applicable (N.A.) and provide the reasons for that determination.

A complete checklist must include the Certification set forth below signed by the Registered Professional Engineer who prepared the Stormwater Report.

Registered Professional Engineer's Certification

I have reviewed the Stormwater Report, including the soil evaluation, computations, Long-term Pollution Prevention Plan, the Construction Period Erosion and Sedimentation Control Plan (if included), the Long-term Post-Construction Operation and Maintenance Plan, the Illicit Discharge Compliance Statement (if included) and the plans showing the stormwater management system, and have determined that they have been prepared in accordance with the requirements of the Stormwater Management Standards as further elaborated by the Massachusetts Stormwater Handbook. I have also determined that the information presented in the Stormwater Checklist is accurate and that the information presented in the Stormwater Report accurately reflects conditions at the site as of the date of this permit application.

Registered Professional Engineer Block and Signature

Signature and Date

Checklist

Project Type: Is the application for new development, redevelopment, or a mix of new and redevelopment?

☒ New development

☐ Redevelopment

☐ Mix of New Development and Redevelopment

Checklist for Stormwater Report

Checklist (continued)

LID Measures: Stormwater Standards require LID measures to be considered. Document what environmentally sensitive design and LID Techniques were considered during the planning and design of the project:

☒ No disturbance to any Wetland Resource Areas

☐ Site Design Practices (e.g. clustered development, reduced frontage setbacks)

☐ Reduced Impervious Area (Redevelopment Only)

☒ Minimizing disturbance to existing trees and shrubs

☐ LID Site Design Credit Requested:

- ☐ Credit 1
- ☐ Credit 2
- ☐ Credit 3

☒ Use of "country drainage" versus curb and gutter conveyance and pipe

☒ Bioretention Cells (includes Rain Gardens)

☐ Constructed Stormwater Wetlands (includes Gravel Wetlands designs)

☐ Treebox Filter

☐ Water Quality Swale

☒ Grass Channel

☐ Green Roof

☐ Other (describe): _____

Standard 1: No New Untreated Discharges

☒ No new untreated discharges

☐ Outlets have been designed so there is no erosion or scour to wetlands and waters of the Commonwealth

☐ Supporting calculations specified in Volume 3 of the Massachusetts Stormwater Handbook included.

Checklist for Stormwater Report

Checklist (continued)

Standard 2: Peak Rate Attenuation

☐ Standard 2 waiver requested because the project is located in land subject to coastal storm flowage and stormwater discharge is to a wetland subject to coastal flooding.

☐ Evaluation provided to determine whether off-site flooding increases during the 100-year 24-hour storm.

☒ Calculations provided to show that post-development peak discharge rates do not exceed pre-development rates for the 2-year and 10-year 24-hour storms. If evaluation shows that off-site flooding increases during the 100-year 24-hour storm, calculations are also provided to show that post-development peak discharge rates do not exceed pre-development rates for the 100-year 24-hour storm.

Standard 3: Recharge

☐ Soil Analysis provided.

☐ Required Recharge Volume calculation provided.

☐ Required Recharge volume reduced through use of the LID site Design Credits.

☐ Sizing the infiltration, BMPs is based on the following method: Check the method used.

☐ Static ☐ Simple Dynamic ☐ Dynamic Field[1]

☐ Runoff from all impervious areas at the site discharging to the infiltration BMP.

☐ Runoff from all impervious areas at the site is *not* discharging to the infiltration BMP and calculations are provided showing that the drainage area contributing runoff to the infiltration BMPs is sufficient to generate the required recharge volume.

☐ Recharge BMPs have been sized to infiltrate the Required Recharge Volume.

☐ Recharge BMPs have been sized to infiltrate the Required Recharge Volume *only* to the maximum extent practicable for the following reason:

- ☐ Site is comprised solely of C and D soils and/or bedrock at the land surface
- ☐ M.G.L. c. 21E sites pursuant to 310 CMR 40.0000
- ☐ Solid Waste Landfill pursuant to 310 CMR 19.000
- ☐ Project is otherwise subject to Stormwater Management Standards only to the maximum extent practicable.

☐ Calculations showing that the infiltration BMPs will drain in 72 hours are provided.

☐ Property includes a M.G.L. c. 21E site or a solid waste landfill and a mounding analysis is included.

[1] 80% TSS removal is required prior to discharge to infiltration BMP if Dynamic Field method is used.

Checklist for Stormwater Report

Checklist (continued)

Standard 3: Recharge (continued)

☐ The infiltration BMP is used to attenuate peak flows during storms greater than or equal to the 10-year 24-hour storm and separation to seasonal high groundwater is less than 4 feet and a mounding analysis is provided.

☐ Documentation is provided showing that infiltration BMPs do not adversely impact nearby wetland resource areas.

Standard 4: Water Quality

The Long-Term Pollution Prevention Plan typically includes the following:

- Good housekeeping practices;
- Provisions for storing materials and waste products inside or under cover;
- Vehicle washing controls;
- Requirements for routine inspections and maintenance of stormwater BMPs;
- Spill prevention and response plans;
- Provisions for maintenance of lawns, gardens, and other landscaped areas;
- Requirements for storage and use of fertilizers, herbicides, and pesticides;
- Pet waste management provisions;
- Provisions for operation and management of septic systems;
- Provisions for solid waste management;
- Snow disposal and plowing plans relative to Wetland Resource Areas;
- Winter Road Salt and/or Sand Use and Storage restrictions;
- Street sweeping schedules;
- Provisions for prevention of illicit discharges to the stormwater management system;
- Documentation that Stormwater BMPs are designed to provide for shutdown and containment in the event of a spill or discharges to or near critical areas or from LUHPPL;
- Training for staff or personnel involved with implementing Long-Term Pollution Prevention Plan;
- List of Emergency contacts for implementing Long-Term Pollution Prevention Plan.

☐ A Long-Term Pollution Prevention Plan is attached to Stormwater Report and is included as an attachment to the Wetlands Notice of Intent.

☐ Treatment BMPs subject to the 44% TSS removal pretreatment requirement and the one inch rule for calculating the water quality volume are included, and discharge:

- ☐ is within the Zone II or Interim Wellhead Protection Area
- ☐ is near or to other critical areas
- ☐ is within soils with a rapid infiltration rate (greater than 2.4 inches per hour)
- ☐ involves runoff from land uses with higher potential pollutant loads.

☐ The Required Water Quality Volume is reduced through use of the LID site Design Credits.

☒ Calculations documenting that the treatment train meets the 80% TSS removal requirement and, if applicable, the 44% TSS removal pretreatment requirement, are provided.

Checklist for Stormwater Report

Checklist (continued)

Standard 4: Water Quality (continued)

☐ The BMP is sized (and calculations provided) based on:

☒ The ½" or 1" Water Quality Volume or

☐ The equivalent flow rate associated with the Water Quality Volume and documentation is provided showing that the BMP treats the required water quality volume.

☐ The applicant proposes to use proprietary BMPs, and documentation supporting use of proprietary BMP and proposed TSS removal rate is provided. This documentation may be in the form of the propriety BMP checklist found in Volume 2, Chapter 4 of the Massachusetts Stormwater Handbook and submitting copies of the TARP Report, STEP Report, and/or other third party studies verifying performance of the proprietary BMPs.

☐ A TMDL exists that indicates a need to reduce pollutants other than TSS and documentation showing that the BMPs selected are consistent with the TMDL is provided.

Standard 5: Land Uses With Higher Potential Pollutant Loads (LUHPPLs)

☐ The NPDES Multi-Sector General Permit covers the land use and the Stormwater Pollution Prevention Plan (SWPPP) has been included with the Stormwater Report.

☒ The NPDES Multi-Sector General Permit covers the land use and the SWPPP will be submitted ***prior to*** the discharge of stormwater to the post-construction stormwater BMPs.

☐ The NPDES Multi-Sector General Permit does ***not*** cover the land use.

☐ LUHPPLs are located at the site and industry specific source control and pollution prevention measures have been proposed to reduce or eliminate the exposure of LUHPPLs to rain, snow, snow melt and runoff, and been included in the long term Pollution Prevention Plan.

☐ All exposure has been eliminated.

☐ All exposure has ***not*** been eliminated and all BMPs selected are on MassDEP LUHPPL list.

☐ The LUHPPL has the potential to generate runoff with moderate to higher concentrations of oil and grease (e.g. all parking lots with >1000 vehicle trips per day) and the treatment train includes an oil grit separator, a filtering bioretention area, a sand filter or equivalent.

Standard 6: Critical Areas

☐ The discharge is near or to a critical area and the treatment train includes only BMPs that MassDEP has approved for stormwater discharges to or near that particular class of critical area.

☐ Critical areas and BMPs are identified in the Stormwater Report.

Checklist for Stormwater Report

Checklist (continued)

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the maximum extent practicable

☐ The project is subject to the Stormwater Management Standards only to the maximum Extent Practicable as a:

- ☐ Limited Project
- ☐ Small Residential Projects: 5-9 single family houses or 5-9 units in a multi-family development provided there is no discharge that may potentially affect a critical area.
- ☐ Small Residential Projects: 2-4 single family houses or 2-4 units in a multi-family development with a discharge to a critical area
- ☐ Marina and/or boatyard provided the hull painting, service and maintenance areas are protected from exposure to rain, snow, snow melt and runoff
- ☐ Bike Path and/or Foot Path
- ☐ Redevelopment Project
- ☐ Redevelopment portion of mix of new and redevelopment.

☐ Certain standards are not fully met (Standard No. 1, 8, 9, and 10 must always be fully met) and an explanation of why these standards are not met is contained in the Stormwater Report.

☐ The project involves redevelopment and a description of all measures that have been taken to improve existing conditions is provided in the Stormwater Report. The redevelopment checklist found in Volume 2 Chapter 3 of the Massachusetts Stormwater Handbook may be used to document that the proposed stormwater management system (a) complies with Standards 2, 3 and the pretreatment and structural BMP requirements of Standards 4-6 to the maximum extent practicable and (b) improves existing conditions.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control

A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan must include the following information:

- Narrative;
- Construction Period Operation and Maintenance Plan;
- Names of Persons or Entity Responsible for Plan Compliance;
- Construction Period Pollution Prevention Measures;
- Erosion and Sedimentation Control Plan Drawings;
- Detail drawings and specifications for erosion control BMPs, including sizing calculations;
- Vegetation Planning;
- Site Development Plan;
- Construction Sequencing Plan;
- Sequencing of Erosion and Sedimentation Controls;
- Operation and Maintenance of Erosion and Sedimentation Controls;
- Inspection Schedule;
- Maintenance Schedule;
- Inspection and Maintenance Log Form.

☒ A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan containing the information set forth above has been included in the Stormwater Report.

Checklist for Stormwater Report

Checklist (continued)

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control (continued)

☐ The project is highly complex and information is included in the Stormwater Report that explains why it is not possible to submit the Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan with the application. A Construction Period Pollution Prevention and Erosion and Sedimentation Control has ***not*** been included in the Stormwater Report but will be submitted ***before*** land disturbance begins.

☐ The project is ***not*** covered by a NPDES Construction General Permit.

☐ The project is covered by a NPDES Construction General Permit and a copy of the SWPPP is in the Stormwater Report.

☒ The project is covered by a NPDES Construction General Permit but no SWPPP been submitted. The SWPPP will be submitted BEFORE land disturbance begins.

Standard 9: Operation and Maintenance Plan

☒ The Post Construction Operation and Maintenance Plan is included in the Stormwater Report and includes the following information:

- ☐ Name of the stormwater management system owners;
- ☐ Party responsible for operation and maintenance;
- ☐ Schedule for implementation of routine and non-routine maintenance tasks;
- ☐ Plan showing the location of all stormwater BMPs maintenance access areas;
- ☐ Description and delineation of public safety features;
- ☐ Estimated operation and maintenance budget; and
- ☐ Operation and Maintenance Log Form.

☐ The responsible party is ***not*** the owner of the parcel where the BMP is located and the Stormwater Report includes the following submissions:

- ☐ A copy of the legal instrument (deed, homeowner's association, utility trust or other legal entity) that establishes the terms of and legal responsibility for the operation and maintenance of the project site stormwater BMPs;
- ☐ A plan and easement deed that allows site access for the legal entity to operate and maintain BMP functions.

Standard 10: Prohibition of Illicit Discharges

☒ The Long-Term Pollution Prevention Plan includes measures to prevent illicit discharges;

☐ An Illicit Discharge Compliance Statement is attached;

☐ NO Illicit Discharge Compliance Statement is attached but will be submitted ***prior to*** the discharge of any stormwater to post-construction BMPs.

Stormwater Report Narrative

This Stormwater Report has been prepared to demonstrate compliance with the Massachusetts Stormwater Management Standards in accordance with the Massachusetts Wetlands Protection Act Regulations (310 CMR 10.00) and Water Quality Certification Regulations (314 CMR 9.00).

Project Description

The Applicant, MassDOT, is proposing to construct a commuter rail station (the Project) at Taunton Depot Shopping Mall, Taunton Depot Drive in Taunton, Massachusetts along the New Bedford Main Line. As proposed, the Project will require approximately 13 acres of land acquisition, of which approximately 6 acres will be developed for the new station, with the remaining land mostly vegetated wetlands. The Project will involve a center platform with canopy, ancillary landscape improvements, 398 parking spaces, a pick up/drop off area, bicycle parking facilities, and utility improvements to support this use. The Project will also construct a sidewalk that connects the station to the existing sidewalk on Taunton Depot Drive and to the Taunton Gardens apartment complex.

The site is not considered a Land Use with Higher Potential Pollutant Loads (LUHPPL) as defined in 3.10 CMR 10.04 and 314 CMR 9.02 because it is not a parking lot with a high-intensity use (1,000 vehicle trips per day or more).

Site Description

The Project Site consists of approximately 6 acres of land (the Site) located at Taunton Depot Drive in Taunton, Massachusetts (see Figure 1 & 2). Vegetated wetlands surround the Site on south, west, and north sides with the New Bedford Main Line tracks to the west of the wetlands. The Site is west of the Taunton Depot Shopping Center and is bound by retail buildings to the east and vegetated area and wetlands to the north, west, and south. The New Bedford Main Line tracks are on an elevated berm to the west, just beyond the wetlands. There is an existing stormwater basin for the shopping center drainage system located to the immediate southeast of the Site. A paved driveway leads to a pump station in the northwest corner of the Site and there are many dirt paths throughout the Site. See Figure 1, Site Locus Map.

Wetland Resource Areas on the Site, shown in Figures 3 and 4, are described in Table 1. For additional information regarding the wetland resource areas present on the site see the Abbreviated Notice of Resource Area Delineation (ANRAD) prepared by VHB dated May 2011.

Table 1
Wetland Resource Areas

Name	*Critical Area*	*Zone 1 or Zone A*	*ORW or SRW*	*Zone II or IWPA*	*Description*
Wetland 1 (TCM-7 East)	No	No	No	No	PFO/PEM
Wetland 3	No	No	No	No	Deep Marsh

Notes: Wetland Classifications: PEM = Palustrine Emergent, PFO = Palustrine Forested

According to the National Resources Conservation Service (NRCS), surface soils on the Site include Deerfield loamy sand, Scarboro mucky loamy fine sand, Whitman fine sandy loam, and Hinckley sandy loam, and are classified as Hydrologic Soil Groups (HSG) B, D, D, and A, respectively. Based on the soil evaluation, the Site is not considered to be within an area of rapid infiltration (soils with a saturated hydraulic conductivity greater than 2.4 inches per hour). Most of the Site has A and B soils which, according to 1982 Rawls Rates, infiltration rates for the soils will be approximately 1.02 inches per hour.

The project is not located within the 100-year flood plain as shown on FEMA Floodway Map, City of Taunton, Massachusetts Bristol County, Community Panel number 25005C0164F dated July 7, 2009, included in Appendix B.

Existing Drainage Conditions

Under existing conditions, the Site consists of mostly cleared, undeveloped land, and is generally surrounded by vegetated wetlands. The Site is primarily dirt and gravel with some pockets of scrub shrubs and grass. There are dirt paths throughout the site and a paved driveway is in the northeast corner of the Site. Runoff sheet flows across the Site, resulting in considerable erosion and deposition into the wetlands. Groundwater is high throughout the Site, ranging from one to four feet below grade in the upland area. For the existing conditions hydrologic analysis, the site was divided into two drainage areas that contribute to two design points. The following is a summary of each drainage area.

Drainage Area 1 – This approximately 5.0-area comprises the majority of the Site and stretches from the northeast portion of the Site, across the northern and western parts, to the southwestern edge. The area consists of bare earth dirt and gravel with many pockets of sparse grass and a few clumps of saplings. Runoff from Drainage Area 1 flows in a westerly direction to Wetland 1 on the west side of the site.

Drainage Area 2 – This approximately 1.0-acre area in the southeast portion of the Site consists of bare earth dirt and gravel with many pockets of sparsely grassed landscape. Lightly wooded areas are minimally present as well. Runoff from Drainage Area 2 flows in a southerly direction to Wetland 2 on the south side of the site.

Figure 3 illustrates the existing drainage patterns on the Site. Table 2 below provides a summary of the existing conditions hydrologic data.

Table 2
Existing Conditions Hydrologic Data

Drainage Area	*Discharge Location*	*Design Point*	*Area (acres)*	*Curve Number*	*Time of Concentration (min)*
1	Wetland 1	1	4.97	67	13.3
2	Wetland 3	2	0.99	63	9.1

Proposed Drainage Conditions

Figure 4 illustrates the proposed "post construction" drainage conditions for the project. As shown, the Site will be divided into five drainage areas that discharge treated stormwater to the two existing Design Points. The runoff from the paved areas is split between three drainage areas that flow to three lined bioretention basins, used to control peak rates and treat the stormwater. Existing drainage and grading patterns were maintained to the maximum extent possible. Drainage Areas 1, 2, and 4 flow to Design Point 1 and Drainage Areas 3 and 5 flow to Design Point 2. Low impact development stormwater management techniques have been incorporated into the design. These practices are focused on decentralizing stormwater management techniques into the design that will reduce peak runoff rates and treat for water quality. Water quality basins are dispersed around the perimeter of the development area. The following is a summary of each drainage area.

Drainage Area 1 – This 1.99-acre area in the northern portion of the site consists of a paved parking area for the station and Bioretention Basin 1 to the north of the parking. Runoff from Drainage Area 1 is directed through drainage grates in the sidewalk to Bioretention Basin 1, which discharges to Wetland 1.

Drainage Area 2 – This 1.35-acre area in the southern portion of the site consists of a paved parking area for the station and Bioretention Basin 2 to the south of the parking. Runoff from Drainage Area 2 is directed to Bioretention Basin 2, which discharges to Wetland 1.

Drainage Area 3 – This 1.35-acre area in the east portion of the site consists of the entrance drive, some of the paved parking for the station, grassed landscape area, and Bioretention Basin 3 to the south of the parking. Runoff from Drainage Area 3 is directed to a grassed swale that flows to Bioretention Basin 3, which discharges to Wetland 3.

Drainage Area 4 – This 1.00-acre area wraps around the perimeter of the site from the northeast corner, around the northwest portion of the Site, to the southwest corner. The area consists mostly of sloped grassed areas but also includes the new paved entranceway to the pump station. Runoff from the new pavement is captured by a grassed swale which flows to Wetland 1. Runoff from the rest of Drainage Arera 4 flows directly to Wetland 1.

Drainage Area 5 – This 0.29-acre area wraps around the southeastern perimeter of the site and consists of sloped grassed areas. Runoff flows directly to Wetland 3.

Table 3 below provides a summary of the proposed conditions hydrologic data.

Table 3
Proposed Conditions Hydrologic Data

Drainage Area	*Discharge Location*	*Design Point*	*Area (acres)*	*Curve Number*	*Time of Concentration (min)*
1	Wetland 1	1	1.99	92	5.0
2	Wetland 1	1	1.35	97	5.0
3	Wetland 3	2	1.35	77	5.3
4	Wetland 1	1	1.00	66	5.0
5	Wetland 3	2	0.29	65	8.9

Integrated into the site design is a comprehensive stormwater management system that has been developed in accordance with the Massachusetts Stormwater Handbook. The proposed stormwater management system has been designed to treat the half inch Water Quality Volume.

Environmentally Sensitive and Low Impact Development (LID) Techniques

Low Impact Development (LID) techniques and stormwater Best Management Practices (BMPs) implemented into the site design include:

- Bioretention basins
- Light colored pavement sidewalks
- Grassed swale

Most of the runoff from Drainage Area 3 will sheet flow to a grass swale before it is connected to bioretention Basin 3. The bioretention basins have been designed with soils to mimic the hydrology of the existing conditions in the upland areas

Regulatory Compliance

Massachusetts Department of Environmental Protection (DEP) - Stormwater Management Standards

As demonstrated below, the proposed Project fully complies with the DEP Stormwater Management Standards at 310 CMR 10.05.

Standard 1: No New Untreated Discharges or Erosion to Wetlands

The Project has been designed to fully comply with Standard 1.

The Best Management Practices (BMPs) included in the proposed stormwater management system have been designed in accordance with the Massachusetts Stormwater Handbook. Supporting information and computations demonstrating that no new untreated discharges will result from the Project are presented through compliance with Standards 4 through 6.

All proposed Project stormwater outlets and conveyances have been designed to not cause erosion or scour to wetlands or receiving waters. Drainage basin outlets have been designed with flared end sections and stone protection to dissipate discharge velocities. Overflows from BMPs that impound stormwater have been designed with stone to protect downgradient areas from erosion.

Computations and supporting information for the sizing and selection of materials used to protect from scour and erosion are included in Appendix A.

Standard 2: Peak Rate Attenuation

The Project has been designed to fully comply with Standard 2.

The rainfall-runoff response of the Site under existing and proposed conditions was analyzed for storm events with recurrence intervals of 2, 10, and 100-years. The results of the analysis, as summarized in Table 4 below, indicate that there is no increase in peak discharge rates between the existing and proposed conditions.

Computations and supporting information regarding the hydrologic modeling are included in Appendix B.

Table 4
Peak Discharge Rates (cfs*)

Design Point	*2-year*	*10-year*	*100-year*
Design Point 1: Wetland 1			
Existing	3.1	7.2	15.2
Proposed	3.0	5.3	10.9
Design Point 2: Wetland 3			
Existing	0.5	1.3	3.0
Proposed	0.4	1.0	2.9

Standard 3: Stormwater Recharge

As described in the site description, the existing surface soils on the Site are comprised primarily of HSG B soils and provide an infiltration rate of approximately 1.02 inches per hour, according to 1982 Rawls Rates. In addition to the soil parameters, the Site has both a flat geography and a seasonal high groundwater table approximately one foot below existing grade that hinder the ability to provide the required two foot separation between the bottom of an infiltration structure and the seasonal high groundwater table. In existing conditions, however, infiltration on the site provides subsurface flow to wetland resource areas along the Site's border.

In an effort to mimic the Site's natural hydrology and meet the intent of the recharge requirements of Standard 3, the onsite bioretention basins have been oversized for treatment and exceed the Required Recharge Volume. The bioretention basins are required to be lined due to the elevation of the seasonal high groundwater table that does not allow for a separation of greater than two feet from the bottom of the bioretention basins. The soil within the bioretention basins however will be designed to approximate the infiltration rates of the existing soils (1.02 inches per hour) and provide two feet of depth in order to mimic the necessary separation from the seasonal high groundwater table and exceed that of existing conditions. After runoff is filtered through the two feet of biofiltration soil media, underdrains within the bioretention basins will slowly convey water to the wetland resource areas that surround the site, mimicking the base flows to the wetlands provided by the subsurface flows of the existing conditions.

A Geotechnical Report is included in Appendix E. The report indicates that the site has high groundwater so the basins will be lined.

Standard 4: Water Quality

The Project has been designed to fully comply with Standard 4.

The proposed stormwater management system implements a treatment train of BMPs that has been designed to provide a minimum of 80% TSS removal for stormwater runoff from all proposed impervious surfaces.

Computations and supporting information are included in Appendix D.

Standard 5: Land Uses with Higher Potential Pollutant Loads (LUHPPLs)

The site is not considered a LUHPPL as defined in 3.10 CMR 10.04 and 314 CMR 9.02 because it is not a parking lot with a high-intensity use (1,000 vehicle trips per day or more).

Standard 6: Critical Areas

The Project will not discharge stormwater near or to a critical area.

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the Maximum Extent Practicable

The Project is not a redevelopment.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Controls

The Project would disturb approximately 6.0 acres of land and is therefore required to obtain coverage under the Environmental Protection Agency (EPA) National Pollutant Discharge Elimination System (NPDES) Construction General Permit (CGP). As required under this permit, a Stormwater Pollution Prevention Plan (SWPPP) would be developed and a Notice of Intent for the CGP would be submitted by the contractor and owner at least 14 days before land disturbance begins. Recommended construction period pollution prevention and erosion and sedimentation controls were discussed in the DEIR/S. Appropriate controls will be prepared and implemented by the contractor and MassDOT (MBTA) during construction in accordance with the final design and NPDES SWPPP.

Standard 9: Operation and Maintenance Plan

In compliance with Standard 9, a Post Construction Stormwater Operation and Maintenance (O&M) Plan will be developed by the MBTA during final design for the Project.

Standard 10: Prohibition of Illicit Discharges

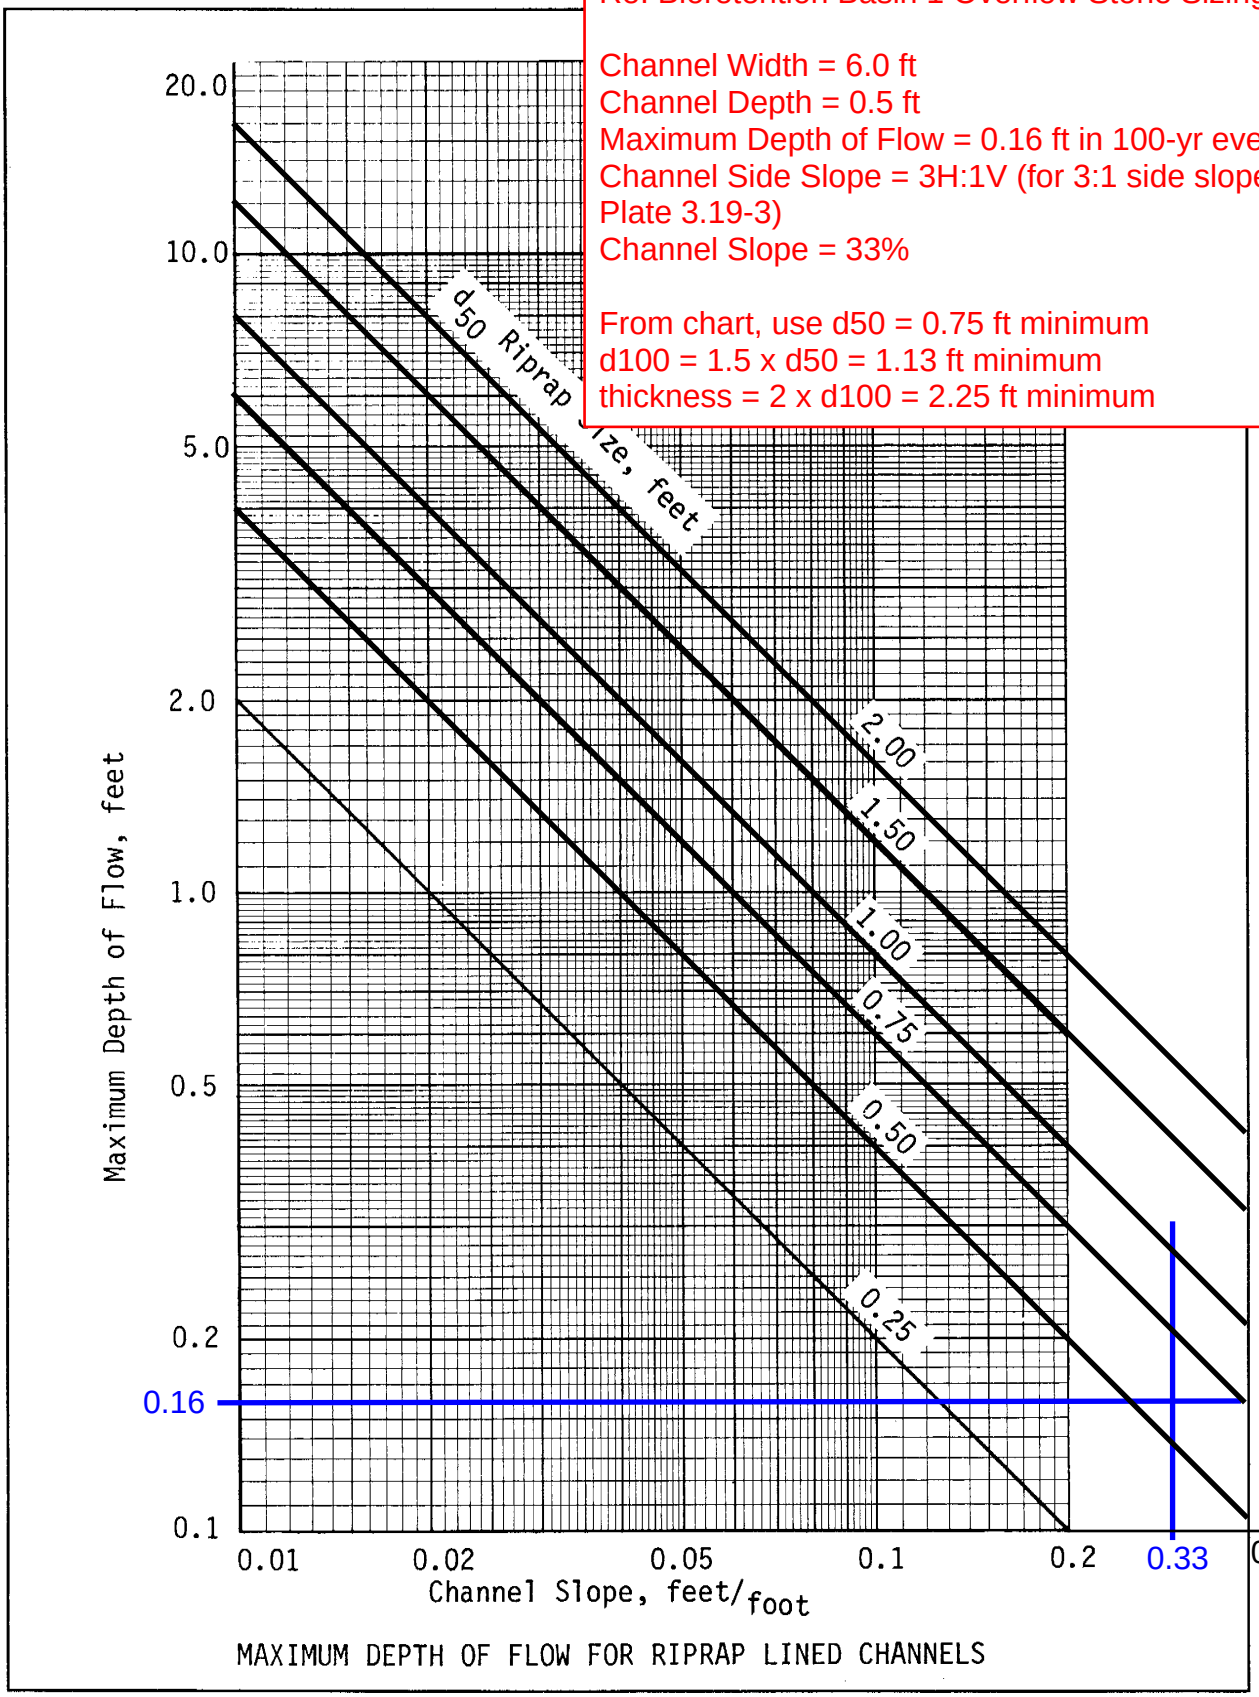
The site was previously undeveloped and no sanitary sewer or storm drainage infrastructure is known to exist on the site. The design plans submitted with this report have been designed in full compliance with current standards. The Long-Term Pollution Prevention Plan will include measures to prevent illicit discharges.

Appendix A
Standard 1 Computations and Supporting Information

Project No: 10111 Project Name: SCR
Date: April 2012 Location: Taunton, MA
Calculated By: EJM
Re: Bioretention Basin 1 Overflow Stone Sizing

Channel Width = 6.0 ft
Channel Depth = 0.5 ft
Maximum Depth of Flow = 0.16 ft in 100-yr event
Channel Side Slope = 3H:1V (for 3:1 side slope, use Plate 3.19-3)
Channel Slope = 33%

From chart, use d50 = 0.75 ft minimum
d100 = 1.5 x d50 = 1.13 ft minimum
thickness = 2 x d100 = 2.25 ft minimum



Source: VDOT Drainage Manual Plate 3.19-3

*Sizing calculations represent minimum stone size. Larger stone may be required per detail plans.

Appendix B
Standard 2 Computations and Supporting Information

Rainfall volumes used for this analysis were based on the Natural Resources Conservation Service (NRCS) Type III, 24-hour storm event for Bristol County. Runoff coefficients for the existing and proposed conditions, as previously shown in Tables 1 and 2 respectively, were determined using NRCS Technical Release 55 (TR-55) methodology as provided in HydroCAD. The HydroCAD model is based on the NRCS Technical Release 20 (TR-20) Model for Project Formulation Hydrology.

MAP INFORMATION

Map Scale: 1:3,170 if printed on A size (8.5" × 11") sheet.

The soil surveys that comprise your AOI were mapped at 1:20,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for accurate map measurements.

Soil Survey Area: Bristol County, Massachusetts, Northern Part
Survey Area Data: Version 5, Jul 27, 2010

Date(s) aerial images were photographed: 8/14/2003; 7/10/2003; 8/15/2003

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Hydrologic Soil Group— Summary by Map Unit — Bristol County, Massachusetts, Northern Part (MA602)				
Map unit symbol	**Map unit name**	**Rating**	**Acres in AOI**	**Percent of AOI**
9A	Birdsall silt loam, 0 to 3 percent slopes	D	3.1	16.8%
43A	Scarboro mucky loamy fine sand, 0 to 3 percent slopes	D	2.5	13.9%
73A	Whitman fine sandy loam, 0 to 3 percent slopes, extremely stony	D	2.1	11.4%
245B	Hinckley sandy loam, 3 to 8 percent slopes	A	1.2	6.6%
256A	Deerfield loamy sand, 0 to 3 percent slopes	B	8.3	45.7%
306B	Paxton fine sandy loam, 0 to 8 percent slopes, very stony	C	1.0	5.7%
Totals for Area of Interest			**18.2**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Geotechnical Report

JACOBS™
343 Congress Street
Boston, MA 02210

Design Memorandum

Date	March 29, 2012
To	Rick Carey, Natasha Velickovic - VHB
From	Paul Murphy, Da Ha, Peter Chou - Jacobs
Subject	MBTA South Coast Rail (New Bedford/Fall River Commuter Rail Extension) Taunton Depot Station Geotechnical Design Memorandum Taunton, MA
Project No.	E2347101

INTRODUCTION

The South Coast Rail project will restore passenger rail transportation from South Station in Boston to the cities of Fall River and New Bedford along an existing rail freight corridor running south from Taunton to Fall River and New Bedford. The project will include the construction of several existing and new passenger stations and two terminal layover facilities. This geotechnical design memorandum presents the foundation design considerations for the new station platform at the proposed Taunton Depot Station in Taunton, Massachusetts. The design recommendations presented in this report are based on the results of subsurface investigation performed by Jacobs in 2002 and 2010.

Existing Conditions

The proposed Taunton Depot Station site is behind the Target Plaza off of Route 140 in Taunton (Figure 1). Except for the two railroad tracks along the west side of the site, the site is currently undeveloped, with half the site cleared and half the site with forests and wetlands. Six large floor-plan retail buildings on the adjacent shopping plaza contain numerous retail establishments. Existing grades at the platform location range from elevations 38.6 to 32.9 feet (NGVD29 Datum), generally sloping downward from south to north.

Proposed Construction

Current station plans are to construct an 800 foot long, 12 foot wide high level center platform adjacent to the existing tracks with some track relocation required, as well as the addition of a third track, a new parking area (with access roads) and a new drop-off area. The tracks and the platform will be constructed on an embankment supported by 3 to 14 feet high retaining walls on both the west and east sides of the tracks.

Access to the platform will be from a new ramp/stair structure along the east side of the tracks with a pedestrian bridge over the wetland and northbound tracks to the platform. Approximately 320 feet of the platform will be under a new station canopy. The details of new track layout (including grading), associated sidewalks and ramps of the proposed station are still under development at the time of this report preparation. However, we anticipate that about 3-8 feet of fill will be placed at the site to raise the grade at the track level and platform area. This report focuses on the foundations for the platform, the ramp/stair structure and the pedestrian bridge.

SCOPE OF WORK

This memorandum was prepared by Jacobs in accordance with the scope of work under the contract between Jacobs and VHB for work on the New Bedford/Fall River Commuter Rail Line Extension Project for Massachusetts Bay Transportation Authority (MBTA). The geotechnical work included the following tasks:

- Perform a geotechnical exploration and laboratory testing program;
- Report and interpret the results of the exploration and laboratory testing program; and
- Provide geotechnical recommendations for design and construction of the platform foundations.

The Jacobs scope of work did not include environmental analyses to assess the potential presence of any hazardous materials at the project site or potential impacts to adjacent structures during construction.

LOCAL GEOLOGY

The site is located in the Narragansett Basin of southeastern Massachusetts. The rocks in the Narragansett Basin consist mostly of lightly metamorphosed shale and sandstone of Pennsylvanian and Permian age. The Taunton Depot site is located in the area of the Rhode Island Formation. The rocks encountered in the borings included coarse grained, weathered sandstone and dark gray siltstone. The upper few feet of the rock has been weathered to soil and was sampled by Standard Penetration Tests in some borings. The less-weathered rock was cored with RQD values ranging from 18 to 50. The cored rock was partially weathered and had both high-angle and bedding-plane joints, which had a dip of about 10 to 20 degrees.

GEOTECHNICAL INVESTIGATION

Jacobs planned the subsurface exploration program and retained the drilling contractors to perform the explorations. The results of the explorations were presented in geotechnical data reports entitled "New Bedford Line – South of Weir Junction Geotechnical Data Report" and "South Coast Rail, Jacobs Geotechnical Data Report" submitted in 2002 and 2010, respectively. Six borings (TD-1 and NBA-12 to NBA-16) were conducted along the proposed station platform and fifteen borings (TD-2 to TD-6, NBS-1 to NBS-5 and NBS-8 to NBS-12) were drilled in the general vicinity of the proposed parking lot and access roads. Boring locations are shown on the Subsurface Exploration Plan (Figures 2 and 3).

The 2010 borings were drilled by New Hampshire Boring using either a D-50 ATV mounted drill or a CME-75 truck mounted drill rig. The borings were advanced through the soil by wash boring methods using a 4-inch casing and roller bit with water. Standard penetration tests (SPT), consisting of 140-pound hammer dropping 30 inches on a standard 2-inch-diameter (OD) split-spoon sampler, were performed with a safety hammer to establish the consistency of the subsurface soils. The SPT's were typically performed at five foot intervals of depth. The obtained samples were sealed in glass jars to retain their natural moisture. Bedrock was encountered and cored in some of the borings during exploration.

The borings were observed and logged by a representative from Jacobs. The soil samples were classified in the field in accordance with ASTM D-2488, Standard Practice for Description and Identification of Soils (Visual-Manual Procedure) by Jacobs' representative, and appropriate stratum breaks were interpolated from drilling and sampling observations. The boring logs were prepared by Jacobs based on the field classifications and laboratory testing, and are presented in Appendix A.

Note the vertical control datum of the 2002 borings was also the National Geodetic Vertical Datum (NGVD) of 1929, which is generally referred to as U.S. Coast Guard mean sea level.

LABORATORY TESTING

The results of the laboratory testing were previously submitted to VHB in reports entitled "South Coast Rail, Jacobs Geotechnical Data Report", dated November 2010, and "New Bedford Line – South of Weir Junction Geotechnical Data Report", dated October 2002.

Grain size distribution analyses were performed to evaluate the gradation of the fill material and natural granular soils for potential reuse as backfill, if needed, and to confirm sample classifications. The graduation analyses are summarized in Table 1 below and are presented in Appendix B.

Table 1: Laboratory Soil Classification Summary

BORING NO.	SAMPLE NO.	ELEVATION (FEET)	USCS SOIL CLASSIFICATION	W (%)	GRAVEL (%)	SAND (%)	FINES (%)
TD-05	S2	33.9	Silty Sand (SM)	NT	3.1	64.7	32.2

	SS-3	22.9	Silty gravel with sand (GM)	NT	42	36	22

Where: w = natural moisture content, NT = Not Tested. * = Fill

SUBSURFACE CONDITIONS

The subsurface conditions at the site were inferred from the boring data collected for the Taunton Depot Station project, with some interpretations. The subsurface conditions encountered at the station platform area generally consist of a layer of granular fill with thickness of about 3 to 14 feet, underlain by a granular soil layer with thickness ranging from 4 to 14 feet overlying bedrock. Bedrock was encountered at a depth of about 14.5 to 22 feet in the platform area, corresponding to approximately elevations 20.1 to 11.0 feet.

In the vicinity of the proposed parking lot and access road areas, fill materials with thicknesses ranging from approximately 0 to 3 feet were encountered. Bedrock was encountered at a depth about 12.0 to 12.5 feet (corresponding to elevations 17.9 to 15.1 feet).

Subsurface soil conditions are summarized in Table 2 and discussed below.

Table 2: Summary of Subsurface Conditions at Borings

BORING NUMBER	GROUND SURFACE ELEV. (FT)	APPROX. FILL THICKNESS (FT)	TOP OF NATURAL SOIL ELEV. (FT)	APPROX. TOP OF ROCK ELEV. (FT)	BOTTOM OF BORING ELEV. (FT)	APPROX. GROUND WATER ELEV. (FT)	REMARKS

NE: Not encountered at the boring during drilling. Dry: Dry borehole observed

Soil conditions in the platform area generally consisted of the following:

Fill: The fill layer typically consists of mostly granular, loose to dense sand and gravel with trace silt. Top 2 feet of fill may contain slag. The fill layer is generally about 3 to 14 feet in the platform area, and 3 feet or less at all other areas.

Organic Silt: A 3.5 foot thick layer of organic silt was encountered from approximately elevation 12.0 to 15.5 feet at boring NBA-12 at the north side of the platform. Note boring NBA-12 is located adjacent to a wetland area. Organic soils may also exist near other wetland areas at the site.

Natural Granular Deposits: In the platform area, the natural soil deposits below the fill generally consist of predominantly sandy silt and silty sand with up to 25% gravel. These deposits are loose to very dense with Standard Penetration Test (SPT) N-values ranging between 5 and 98 blows per foot (bpf).

Glacial Till: Dense glacial till was encountered at boring TD-1 at elevations ranging from 25.0 to 16.0 feet, and consisted of lean clay with up to 20% sand and gravel. Numerous boulders were encountered in the glacial till.

Bedrock: Bedrock was encountered in the platform area at a depth of about 14.5 to 22 feet below existing ground surface, corresponding to approximately elevations 20.1 to 11.0 feet. The bedrock was soft, jointed, slightly weathered SILTSTONE (TD-1) or moderately hard, very slightly weathered ARGILLITE (NBA-14). Bedrock RQD values at the platform range from 50% to 95%.

Hard, moderately weathered, moderately to highly fractured SANDSTONE (TD-2) was also encountered at elevation 22.6 feet in the pedestrian ramp area. Bedrock RQD values range from 18% to 27%.

Groundwater: Groundwater levels were measured in the observation wells and in test borings using a weighted tape during and at completion of drilling. The data indicated the groundwater level ranged from approximate elevations 35.6 to 23.3 feet along the platform alignment, and from elevations 36.3 to 23.8 feet in the general area of the proposed parking lot. The use of wash boring techniques for some of the soil borings may have artificially increased the water level readings due to the addition of water to the borings. Trapped/perched water is also commonly seen at a higher elevation within existing fill and silty materials. The longer term water level readings taken at Boring TD–1 OW on July 7, 2010 and September 12, 2011 indicated the water at a depth of about 8 feet (Elevation 25.0 feet) and 5.2 feet (Elevation 27.8 feet), respectively. The longer term water level readings taken at Boring TD–6 OW on July 7, 2010 and September 12, 2011 indicated the water at a depth of about 3.5 feet (Elevation 26.4 feet) and 1.0 feet (Elevation 28.9 feet), respectively. Based upon these short-term observations and readings from the observation wells, it is anticipated that the groundwater could be within 3 to 5 feet below existing grade at the platform area and within 1 to 3 feet below existing grade in the parking lot area.

Groundwater levels should be expected to fluctuate with rainfall and other seasonal variations. More long-term observations would be required to evaluate true groundwater levels and their influence on planned construction. Local and periodic variations of ground water elevations may also be influenced by local subsurface drainage, leaking water or sewer pipes, and precipitation.

GEOTECHNICAL RECOMMENDATIONS

Due to variable thickness and consistency of the fill materials within the platform area, it is recommended to use ground improvement techniques to minimize differential settlement and to improve bearing capacity of the foundation soils. The ground should be improved with aggregate stone columns or rammed aggregate piers (RAPs). Stone columns and RAPs create stiff reinforcing elements in the foundation soil mass, thereby improving the soil bearing capacity.

As an alternative, the proposed station platforms can be supported on drilled micropiles extending through unsuitable soils (i.e., existing deep uncontrolled fills and organic soil layers) and bearing into competent natural soils. The use of deep foundations can also minimize the construction impacts on the existing track considering the existing track is active. The same type of foundation should be used for the pedestrian bridge to minimize any differential settlement. Due to the relatively shallow depth to dense to very dense natural soils in the ramp/stair structure area, it may be possible to use shallow spread footings to support this structure.

Platform and canopy design loads were not available at the time of this report preparation. However, it is anticipated that the station platform will be lightly (axially) loaded with limited horizontal forces from wind and seismic loads.

The following paragraphs provide project specific geotechnical recommendations for foundation soil preparation, structural fill/backfill placement, and design and construction of spread footings.

Ground Improvement

The stone column technique, also known as vibro-replacement or vibro-displacement, is a ground improvement process where vertical columns of compacted aggregate are formed through the soils to be improved. These columns result in considerable vertical load carrying capacity and improved shear resistance in the soil mass. The strength parameters of the stone columns-soil composite system can be estimated based on the reference FHWA/RD-83/026 and Priebe (1995). The rammed aggregate pier support elements are generally constructed by drilling a 18- to 36-inch diameter hole, removing or displacing the volume of soil, and then building a bottom bulb of clean, open-graded stone. The rammed aggregate pier is built on top of the bottom bulb, using well-graded highway base course stone placed in thin lifts (12-inches compacted thickness). The result of construction is a reinforced zone of soils directly beneath the foundations. Where subsurface conditions are such that an open hole is difficult to be maintained, the displacement rammed aggregate support elements (Impact System) can be used. In this method, the displacement rammed aggregate piers are installed by driving a variable-diameter mandrel into the soil, thereby displacing the soil laterally to form a cavity, and then filling the ensuing cavity by ramming thin lifts of open-graded aggregate within the cavity as the mandrel is retrieved from the hole.

Drilled Micropiles

Micropiles mainly rely on the grout/ground skin friction (bond) to transfer loads to the ground, since the pile displacement required to mobilize the frictional resistance is significantly less than that to mobilize end bearing. Micropiles should be designed to resist axial, lateral and eccentric loading conditions.

Based on our review of geological conditions and the split-spoon soil samples, it is our opinion that the skin friction within the existing fill and organic soils should be neglected. Type B pressure grouting or Types C and D post-grouting procedures should be required for micropile installation at this station for micropiles installed in soils. For micropiles installed in bedrock, Type A gravity grouting is acceptable. Side friction in soil should be neglected for micropiles bearing in rock. The allowable grout-to-ground bond strengths recommended for the materials encountered for this station are listed in Table 3 below.

Table 3: Summary of Micropile Design Parameters

SOIL/ROCK TYPE	BUOYANT UNIT WEIGHT (PCF)	ALLOWABLE SKIN [2] FRICTION (BOND STRENGTH) TYPE A (PSI)	ALLOWABLE SKIN [2] FRICTION (BOND STRENGTH) TYPES B AND C (PSI)	ALLOWABLE SKIN [2] FRICTION (BOND STRENGTH) TYPE D (PSI)
Fill and Organic Soils	57.5	--	--	--
Medium Dense to Very Dense Granular Soils	62.5	--	6	10
Competent Bedrock	82.5	35	--	--

Notes: 1. Fill/organic thickness ranges from 8 to 20 feet, top of bearing soils shall be top of natural granular soils.
2. Type A gravity grouting procedure is not recommended for micropiles in soil.

For corrosion protection, permanent casing should be installed to a depth of at least 5 feet below the bottom of the encountered fill and organic soils. The permanent casing design should include a 1/8-inch corrosion allowance.

In general, we recommend that the micropiles not be spaced within a distance less than 3 times the drilled holes/grout diameters. This spacing is to eliminate group effect for axially loaded piles bearing within soils.

Spread Footings

Spread footings are recommended for the ramp and stair structure foundations. The footings should be placed on compacted structural fill or on dense natural granular soils. The existing fill appears to have been placed without control and must be removed within the zone of influence of the footing down to natural soils. The zone of influence is defined by a line extending one foot from the bottom edge of the footing and continuing at a 1H:1V slope down to the natural soils.

The recommended allowable design bearing capacity for spread footings bearing on at least medium dense structural fill is 5 ksf, provided that subgrades are prepared as described herein. This provides an adequate factor of safety against bearing failure and limits the total estimated settlement to less than one inch and the differential settlement to less than ½ inch. All footings should be at least 4 feet wide. The bottom of footing elevation should be at least 4 feet below final grades for frost protection.

The structural fill material should be free from organics and other deleterious substances and should conform to the requirements listed in the MBTA Standard Specification Section 02200 - Earthwork for Type B Gravel Borrow. The exposed remaining fill and the structural fill should be compacted to 95% of the maximum dry density as determined by the Modified Proctor compaction test (ASTM D1557) and as described in the following sections.

All temporary open cuts required for footing construction should be in accordance with the related OSHA regulations and should have side slopes of no steeper than 1.5H:1V.

Seismic Consideration

The seismic design should comply with the requirements of the most current Massachusetts State Building Code 780 CMR and other relevant project design codes such as AREMA and AASHTO. Modification of the peak acceleration by the soils overlying bedrock depends upon the type of soil at the site. For the subsurface conditions encountered, the station site is classified as Seismic Site Class D soil profile in accordance with 780 CMR Chapter 1614.0 Section 9.4 Site Ground Motion. The structure could be designed for the total lateral seismic force using the equations specified in the code, or by the response spectrum method using the design spectra presented in the code. The maximum considered earthquake ground motions shall be as represented by the spectral response acceleration at short periods (Ss) and at 1-sec (S_1) obtained from Table 1604.10 of the Massachusetts State Building Code and adjusted for Site Class effects using the site coefficients of Section 9.4.1.2.4.

For Site Class D Soils at the location of this station:

S_{MS} = 0.384 and S_{M1} = 0.149

S_{DS} = 0.256 and S_{D1} = 0.099

where:

- S_{MS} is the maximum consider earthquake spectral response acceleration for short periods adjusted for site class
- S_{M1} is the maximum consider earthquake spectral response acceleration at 1-sec adjusted for site class
- S_{DS} is the design earthquake spectral response acceleration for short periods adjusted for site class
- S_{D1} is the design earthquake spectral response acceleration at 1-sec adjusted for site class

The building code also requires that the soil be evaluated for the following potential hazards: slope instability, soil liquefaction, or surface rupture due to faulting or lateral spreading. The proposed grading is relatively flat and we are not aware of any pre-existing slope instability in this area. The existing overburden soils do not appear to be subject to surface rupture due to faulting or lateral spreading.

Liquefaction

Based on the observed subsurface conditions, recorded water levels, percentage of fine contents and the recorded SPT N-values, the soil layers underlying the site are judged to be not susceptible to liquefaction.

Retaining Walls

The track embankment retaining walls can be a cantilevered sheet pile wall. Steel anchor bars could also be used to connect the top portion of the two sheet pile walls on the east and west sides if analyses indicate bracing is needed. If anchor bars under the tracks are not acceptable to the MBTA, another option for the retaining walls is a soldier pile wall with precast concrete panels. Alternatively, if construction of the walls can be sequenced to limit excavation impacts on the existing tracks, use of Mechanically Stabilized Earth (MSE) walls may be possible.

CONSTRUCTION CONSIDERATIONS

Ground Improvement – Rammed Aggregate Piers/ Stone Columns

If a spread footing foundation option is desired by the designer but mass foundation over-excavation is not cost-effective or feasible, then ground improvement measures (such as rammed aggregate piers or stone columns) below foundation areas can be considered as a foundation alternative. The rammed aggregate piers/stone columns can improve soil bearing capacity characteristics of the existing fill, transfer (portions of) axial loads, and reduce potential foundation settlement. Rammed aggregate pier design and construction is typically provided by a specialty contractor based on a performance criteria, but should be reviewed by the Geotechnical Engineer.

Stone columns and rammed aggregate piers are constructed by excavating a hole (typically 18 to 36 inches in diameter) to the specified design depth (typically to competent soils) by augering or using a mandrel. The soil at the bottom of the hole is then densified with a high impact densification system having a rated energy of 250,000 ft.-lbs. to 1,200,000 ft.-lbs. Thin lifts (6- to 12-inches thick) of dense-grade aggregate or crushed stone are then compacted in the cavity. The proposed platform can then be supported on shallow foundation bearing on soils improved with rammed aggregate piers or stone columns. The footings can be designed based on a higher “composite” soil bearing capacity.

Stone columns and rammed aggregate pier elements are typically installed at about 6 to 8 feet center to center spacing. The length and spacing of the elements will depend on the foundation loads and settlement tolerance.

Drilled Micropiles

The drill rig should have adequate torque and downward pressure to facilitate drilling or coring through any obstruction and drilling into bedrock. A temporary or permanent casing is typically required to provide full length side support within soil embedment especially when drilling through sandy granular soils. The steel casing can provide high shear and bending capacity to resist lateral loads.

Water or polymer drilling mud (for flushing the hole during drilling) can also be used in addition to the casing to provide temporary side support during pile installation. Bentonite slurry may impair grout/ground bond capacity and therefore, it is not recommended.

Grouting under pressure should be performed through a tremie pipe from the bottom to the top of the casing in full until fresh grout tops out. No significant loss of grout from the pile should be observed. Re-grouting (post-grouting) after set of the initial grout may be necessary to improve the grout and ground bond strength within soil embedment. Suitable centralizers should be firmly fixed to maintain the specified grout cover. We recommend that the drilling, installation of the reinforcement, and grouting of a particular pile be completed in a short and continuous processes.

Field load testing including both performance and proof testing should be performed for production micropiles. The pile load test program and proof tests during installation should be conducted as described in the project specifications. Testing procedures and results should be observed and reviewed by the Geotechnical Engineer, and are subject to MBTA approval. In general, the compression load test should be performed in accordance with ASTM D1143 and tension load test in accordance with ASTM D3689.

Spread Footings

The existing fill should be stripped off and removed from within the zone of influence of the walkway area footings using a smooth edge excavation bucket. Following excavation, the exposed surface should be proof compacted with at least 10 passes of a large vibratory drum roller (minimum 10,000 pound static weight). All excavated areas should be backfilled with gravel borrow and compacted to 95% of the maximum dry density (ASTM D1557). Footing inspections should include hand auger probes by the geotechnical personnel to check for soft/weak zones. The need for undercutting and backfilling with structural fill should be closely evaluated in the field based on encountered conditions.

In areas where seepage is encountered within footing excavations, the need for placing a 3" thick lean concrete mud mat or a layer of ¾-inch crushed stone to protect the bearing surface should be evaluated in the field. Crushed stone thicker than 4 inches shall be wrapped by non-woven filter fabric.

Following observation of the bearing soils by geotechnical personnel, reinforcing steel and concrete can be placed in the excavation. It is recommended that footing reinforcing steel and concrete be placed the same day as the footing excavation is made, where possible, to avoid significant moisture content changes in the bearing soils. No water should be allowed to pond within excavations and drainage should be maintained away from foundations both during and after construction. The footing excavation should be free of loose debris at the time of footing concrete placement.

MSE Wall Construction

Wall Subgrade Preparation

Remove existing soil from the area to be occupied by the MSE wall structure, including facing and reinforcing strips, to the required grade, and extending at least 5 feet beyond the edge of structures on all sides. Where practical, final excavation should be undertaken using a smooth edged bucket to limit disturbance of the subgrade.

The exposed subgrade soils should be proof-compacted with a minimum of 10 passes of a minimum 10,000-lb (static weight) heavy vibratory roller. Loose or soft zones observed during proof-compaction should be over-excavated to firm and stable ground and replaced with compacted Gravel Borrow. Where exposed soil subgrades are at or near the groundwater level, static proof-compaction methods may be recommended in lieu of vibratory methods by the geotechnical engineer. Exposed subgrade soils should be protected from disturbance.

Existing fill may remain in place below the undercut zone of the MSE wall; however, if organic soils or soft or disturbed soils are observed, they should be completely removed from within the bearing influence zone of the retaining wall and reinforced soil mass. The bearing influence zone is defined by a one horizontal to one vertical (1H:1V) line sloping down and out from one foot outside the bottom exterior edge of the footing/reinforced soil zone to the exposed subgrade.

Once proof-compaction is complete, a layer of non-woven heavy duty geotextile, in accordance with MassDOT M9.50.0, Type I Separation, or Type II Stabilization geotextile fabric, should be placed at the bottom of excavation. The geotextile should have an Equivalent Opening Size (EOS) suitable to act as a filter to prevent loss of material from the new structural fill (Gravel Borrow) into the underlying existing fill materials (overlap roll ends and sides a minimum of 12 inches).

We recommend that a qualified geotechnical engineer evaluate the bearing subgrade and observe fill placement.

Leveling Pad

We recommend that a minimum 12 inch wide, 6 inch thick leveling pad consisting of reinforced concrete be provided as a leveling pad below the facing panels.

Backfill Material

MSE walls require placement of well-graded, granular soil (i.e. Gravel Borrow, MassDOT M1.03.0, Type a) in order to allow for drainage and to provide resistance to pullout of the reinforcing strips. Fill should be placed in loose lifts no greater than 8 inches thick and compacted to 95% of maximum density as determined by ASTM D1557 up to each layer of reinforcement. The reinforcing strips can be connected to the facing prior to placing subsequent lifts of backfill and reinforcing, or the strips can be wrapped around the subsequent lift, allowing the facing to be installed upon completion of backfilling. The method of construction should be provided by the MSE wall specialty designer and reviewed by the engineer.

Subgrade Preparation

Prior to performing any required grading operations and excavations in the proposed structure footprints, walkway and paved areas, these areas should be stripped of topsoil, vegetation, loose fill, and existing pavement, if present. The topsoil should be placed in a designated area for reuse during final grading. Following site clearing and stripping, the foundation areas should be prepared as discussed above. The exposed soil subgrade should be proof rolled with at least 10 passes of a minimum 10,000-lb (static weight) heavy vibratory roller. Any pockets of excessively soft, wet or disturbed soil or unsuitable soils should be removed and replaced with properly compacted fill materials. Where subgrade soils are close to the existing groundwater level or where silty subgrade soils are encountered, proof-compaction using non-vibratory methods may be considered by the geotechnical engineer.

If additional rolling does not correct the unstable condition, the subgrade should be scarified to a depth of at least six inches but not exceeding eighteen inches, aerated, re-compacted, and retested to provide uniform compaction. Following satisfactory compaction of the subgrade, controlled compacted fill material should be placed to bring the site to the required grade.

Fill should not be placed over frozen soil. Soil subgrades should be protected against frost both during and after construction.

Proper drainage of construction areas should be provided to protect the subgrades from the detrimental effects of weather conditions. Excavations should be made with as few passes of the backhoe bucket as possible to reduce disturbance of the subgrade. A backhoe bucket fitted with a smooth blade should be used during the final subgrade preparation, where necessary. The exposed base should be kept free of standing water at all times. The site should be graded to carry any surface runoff away from the work areas. Construction traffic should be controlled to prevent excessive stresses and disturbance to the subgrade.

If pavements are not constructed immediately after grading, the subgrade should be shaped so as to prevent ponding. If there is a substantial lapse in time between grading and paving, or if the subgrade is disturbed, it should be proof-rolled with a loaded, tandem-wheeled dump truck. Soft spots observed during proof-rolling or initial construction should be removed and replaced with compacted granular fill.

Within the proposed paved areas, and extending a distance of five feet beyond the edge on all sides, excavate existing granular fill soils to a depth of two feet below existing site grades. It may be possible to reuse the existing granular fill, depending on the suitability of the material, as described herein.

Fill Placement and Compaction

Fill materials most likely will be obtained by importing granular fill materials from off-site borrow sources. However, it may be possible to reuse existing site granular fill material provided that it can be properly placed and compacted. The gradation shall be in accordance with MBTA Standard Specification Section 02200-Earthwork for Type B Gravel Borrow.

All structural fill should be free of organics, demolition debris or other deleterious substances. The fill material should have a plasticity index (PI) less than 4 and a liquid limit (LL) less than 10, and contain fragments less than 4 inches in maximum dimension. Each lift should be compacted to the specified density prior to placing any subsequent lift. All materials to be used as structural fill should be tested in the laboratory to determine their project suitability and compaction characteristics.

The fill should be systematically compacted to the following percentages of the maximum dry density:

Table 3: Fill Compaction Requirements

DESCRIPTION	MINIMUM PERCENT COMPACTION (ASTM D-1557)
General Site Fills, Structural Fill (Below Footings and Slabs)	95
Behind Retaining Walls	92
Landscape Area	90

Soils which exhibit a well-defined moisture content–dry density relationship should be compacted to within plus or minus two percentage points of the optimum moisture content as determined by the Modified Proctor test (ASTM D-1557).

Where fill materials are placed against an existing embankment slope, the slope should be benched as the fill is brought up in layers. Benching should be of a sufficient width to permit placing and compaction of fill material upon the existing embankment materials. Typically, benches are between four to eight feet wide. Each bench cut should begin at the intersection of the existing embankment and the vertical side of the previous bench. Trench backfills over pipelines or utility structures should be performed so as not to adversely impact the underlying utilities. In fill areas, the backfill material, compaction method, and degree of compaction requirements should be similar to that for the fill adjacent to the trench.

Construction Dewatering

All excavations should be performed in the dry condition. Discharge of pumped water should be performed in accordance with all federal, state and/or local regulations which may require a discharge permit and possible filtration and chemical testing of the water prior to discharge.

Permanent Slopes

Permanent slopes with loamed and seeded surfaces should not be steeper than 2-1/2 horizontal to 1 vertical (2-1/2H:1V) without slope protection to limit erosion and surficial sloughing of the slope. Additional analyses may be required to assess the stability of slopes steeper than 2-1/2H:1V as the station design is finalized.

Excavation Slopes and Shoring

The slopes of open cuts should be no steeper than 1-1/2H:1V. Open cuts should not be used below the water table because of the likelihood of soil sloughing into the excavation.

The temporary excavation support system, if needed, should be selected by the Contractor and designed by an experienced registered Professional Engineer in the Commonwealth of Massachusetts and retained by the Contractor. Where excavation sides can be sloped back, they should be performed in accordance with the Occupational Safety and Health Administration (OSHA) Construction Industry Standards.

Permanent Retaining Walls

If sheet pile walls or soldier pile walls with precast concrete panels are used for permanent retaining walls, pre-trenching or pre-drilling may be required to remove obstructions and to install piles to sufficient depths into underlying dense soils and bedrock. A minimum of 3 feet of free draining Gravel Borrow should be placed behind the walls and the walls should also have weep holes installed for drainage.

Protection of Existing Facilities

It is recommended that a geotechnical instrumentation and monitoring program be performed during construction of the project to evaluate impacts on adjacent structures. It is recommended that the program be developed to provide data for the following considerations:

- To monitor ground movements and vibration levels during construction.
- To provide early warning of potentially adverse trends by presenting sufficient data to determine the source of unanticipated ground movements, if present.
- If necessary, to plan remedial measures to limit damage to embankments and structures and to provide early warning when alternative means of protection are necessary.
- To document impacts of construction on adjacent facilities.
- To evaluate the performance and structural integrity of the constructed facilities.

We recommend the following instrumentation program to measure:

- Ground surface settlement and lateral movement adjacent to proposed construction.
- Horizontal and vertical movement of any excavation support system, and existing structures.
- Vibrations as a result of construction activities.

Vertical and horizontal survey points should be established on the adjacent structures. The monitoring points should be surveyed prior to the start of construction and monitored during construction to detect movement.

Vibration monitoring should be conducted within 100 feet of existing structures during construction activities.

We recommend conducting a pre-construction survey of structures and utilities within 100 feet of the site to document existing conditions prior to construction. Documentation should include photographs, video, sketches, and/or written comments.

Specific instrumentation and monitoring requirements shall be based on the proposed construction sequence, duration of construction, and performance criteria. Initial measurements should be established well in advance of construction so that baseline data can be developed. This information will be invaluable for providing early warning of adverse trends and for assessing the need for mitigating measures.

CLOSING

This report and the recommendations contained herein have been prepared for the exclusive use of MBTA and VHB and their representatives for specific application to the design and construction of the proposed Taunton Depot Station in Taunton, Massachusetts.

This report was prepared in accordance with generally accepted soil and foundation engineering practices. No warranty, expressed or implied, is made. The analysis, design and recommendations submitted in this report are based in part upon the data obtained from subsurface explorations available at the time of this report. Subsurface stratification variations between borings are anticipated. The reported groundwater levels only represent the water levels at the time noted on the logs. The nature and extent of variations between these explorations may not become evident until construction. If significant variations then appear, or if there are changes in the nature, design or location of the proposed structure, it may be necessary to reevaluate the recommendations of this report.

GEOTECHNICAL LABORATORY TEST DATA

Project : New Bedford/Fall River Commuter Rail
Project No. : GTX-3916
Boring No. : ---
Sample No. : NBA-13 SS-5
Location : Massachusetts
Soil Description : Moist, pale olive sandy silt
Remarks :

Depth : ---
Test Date : 07/26/02
Test Method : ASTM D 422

Filename : NBA13SS5
Elevation : ---
Tested by : srp/jx
Checked by : jdk

Memorandum

APPENDIX C: GEOTECHNICAL CALCULATIONS

- Allowable Bearing Capacity and Estimated Settlement
- Seismic Site Class Evaluation

JACOBS

343 Congress Street
Boston, MA 02210
617/242-9222

CALCULATION WORKSHEET

JOB	MBTA South Coast Rail		
SUBJECT	Taunton Depot Station		
CALCULATED BY	DH	**DATE**	3/28/2012
CHECKED BY	PC	**DATE**	3/29/2012

PURPOSE: Evaluate bearing resistance for ramp/stair structure shallow foundations.

REFERENCE: AASHTO LRFD Bridge Design Specifications, 2010/AREMA Manual for Railway Engineering, 2004

ASSUMPTIONS:

- Ramp/Stair structure footing is 4 ft wide by 6 ft long.
- Bearing surface is silty sand (SM).
- Footing embedment is at least 4 feet below ground surface.
- Groundwater level is at 1 feet below surface.
- Footing eccentricity is assumed to be zero.
- Estimated soil properties (experience, geotech literature, AASHTO Table 10.4.6.2.4-1):

	γ (pcf)	ϕ
Silty Sand:	125	32

BEARING CAPACITY FACTORS (Table 10.6.3.1.2a-1):

	ϕ	N_c	N_q	N_γ
Silty Sand:	32	35.5	23.2	30.2

CALCULATE EFFECTIVE FOOTING WIDTH (B'):

$e < B/4$ (AASHTO Section 10.6.3.3)

where: B = footing width (ft) = 4
e = eccentricity (ft)

Assume maximum footing eccentricity, thus, e = 1

$B' = B-2e$ 2

NOMINAL BEARING RESISTANCE (q_n):

$q_n = cN_{cm} + \gamma D_f N_{qm} C_{wq} + 0.5\gamma B' N_{\gamma m} C_{w\gamma}$ (AASHTO Eqn. 10.6.3.1.2a-1)

where:

c = cohesion = 0		
γ = total unit weight	125	
D_f = depth of footing (ft) =	4	Assumed
B' = effective width of footing (ft) =	2	
L = length of footing (ft) =	6	
B'/L =	0.33	
D_f /B' =	2.00	
L/B' =	3.00	
C_{wq} $C_{w\gamma}$ = groundwater correction factors		(using B')
C_{wq} = 0.6		(AASHTO Table 10.6.3.1.2a-2)
$C_{w\gamma}$ = 0.5		(AASHTO Table 10.6.3.1.2a-2)

N_{cm} N_{qm} $N_{\gamma m}$ = bearing capacity factors

$N_{qm} = N_q s_q d_q i_q$ (AASHTO Eqn. 10.6.3.1.2a-3)

s_q =	1.21	(AASHTO Table 10.6.3.1.2a-3)
d_q =	1.30	(AASHTO Table 10.6.3.1.2a-4)
i_q =	1.0	(see AASHTO p. 10-62)
N_{qm} =	36.4	

$N_{\gamma m} = N_\gamma s_\gamma i_\gamma$

s_γ =	0.87	(AASHTO Table 10.6.3.1.2a-3)
i_γ =	1	(see AASHTO p. 10-62)
$N_{\gamma m}$ =	26.2	

q_n = 12,568 psf

JACOBS™

343 Congress Street
Boston, MA 02210
617/242-9222

CALCULATION WORKSHEET

JOB	MBTA South Coast Rail		
SUBJECT	Taunton Depot Station		
CALCULATED BY	DH	**DATE**	3/28/2012
CHECKED BY	PC	**DATE**	3/29/2012

ALLOWABLE BEARING RESISTANCE (q_a):

$q_a = q_n/FOS$

where: FOS = factor of safety = 3 for primary loads (see AREMA 3.4.2)

q_a = 4,189 psf

use

q_a =	**4.19**	**ksf**

strength limit value

Note: Based on the anticipated light loads and potentially small footing sizes, an allowable bearing capacity of 4 ksf is recommended.

Elastic Settlement Calculations:

$$S_e = \frac{(q_o\,(1-\nu^2)\sqrt{A'})}{144 E_s \beta_z}$$

AASHTO eqn. 10.6.2.4.2-1

where: q_o = applied vert. stress (ksf)
ν = Poisson's Ratio
E_s = Young's Modulus (ksi)
β_z = Shape/Rigidity Factor

ν = Poisson's Ratio =	0.30	(AASHTO Table C10.4.6.3-1)
E_s = Young's Modulus (ksi) =	5.00	(AASHTO Table C10.4.6.3-1)
β_z = Shape/Rigidity Factor =	1.13	(AASHTO Table 10.6.2.4.2-1)

where:

B' = eff. width of footing (ft) =	2	(from bearing resistance calcs)
L = length of footing (ft):	6	(from bearing resistance calcs)
A' =(B'xL) = footing area (ft^2):	12	ft^2

Settlement (S_e) for a given q_o:

q_o = applied vertical stress (ksf) = 4.00 ksf (assumed)

S_e (inches) = 0.19 inches

Taunton Depot Station Seismic Site Class Evaluation

Based on the platform boring with the lowest average blow counts (worst case)

Boring No.	Sample No.	N Value	Di	Di/N_i	N_{bar}
TD-1	S-1	6	3	0.50

Long -71.073333

Seismic Coefficients

S_S = 0.24 (Table 1604.10*)
S_1 = 0.062 (Table 1604.10*)

For Site Class D

F_A = 1.6 (See Table 9.4.1.2.4a*)
F_V = 2.4 (See Table 9.4.1.2.4b*)

Design Spectral Response Parameters

S_{MS} = Ss x F_A = 0.384
S_{M1} = S_1 x F_V = 0.149

S_{DS} = 2/3 x S_{MS} = 0.256
S_{D1} = 2/3 x S_{M1} = 0.099

Per 9.4.1.2.1, $15 < N_{bar} < 50$, Site Class D

9.4.1.2.1 Site Class Definitions. The site shall be classified as one of the following classes:

A = Hard rock with measured shear wave velocity, $\overline{v}_s$ > 5000ft/s (1500 m/s)

B = Rock with 2500 ft/s < $\overline{v}_s$ ≤5000 ft/s (760 m/s < $\overline{v}_s$ ≤ 1500 m/s)

C = Very dense soil and soft rock with 1200 ft/s ≤ $\overline{v}_s$ ≤ 2500 ft/s (370 m/s ≤ $\overline{v}_s$ ≤ 760 m/s) or $\overline{N}$ or $\overline{N}_{ch}$ > 50 or $\overline{s}_u$ ≥ 2000 psf (100 kPa)

D = Stiff soil with 600 ft/s ≤ $\overline{v}_s$ ≤ 1200 ft/s (180 m/s ≤ $\overline{v}_s$ ≤ 370 m/s) or with 15 ≤ $\overline{N}$ or $\overline{N}_{ch}$ ≤ 50 or 1000 psf ≤ $\overline{s}_u$ ≤ 2000 psf (50 kPa ≤ $\overline{s}_u$ ≤ 100 kPa)

E = A soil profile with $\overline{v}_s$ < 600 ft/s (180 m/s) or any profile with more than 10 ft (3 m) of soft clay. Soft clay is defined as soil with *PI* > 20, *w* ≥ 40%, and s_u < 500 psf (25 kPa)

F = Soils requiring site-specific evaluations:

1. Soils vulnerable to potential failure or collapse under seismic loading such as liquefiable soils, quick and highly sensitive clays, collapsible weakly cemented soils. Potential for liquefaction shall be evaluated in accordance with 780 CMR 1804.6: *Liquefaction*.

Exception. None.

2. Peats and/or highly organic clays (*H* > 10 ft [3 m] of peat and/or highly organic clay where *H* = thickness of soil).
3. Very high plasticity clays (H > 25 ft [7.6 m] with *PI* > 75).
4. Very thick soft/medium stiff clays (H>120 ft [37 m].

Exception. None.

Notes: * The Massachusetts State Building Code, 8th Edition (2010)

TABLE 9.4.1.2.4a VALUES OF F_a AS A FUNCTION OF SITE CLASS AND SHORT PERIOD MAXIMUM CONSIDERED EARTHQUAKE SPECTRAL ACCELERATION

Site Class	*Tabulated Maximum Considered Earthquake Spectral Response Acceleration at Short Periods*					
	$S_S \le 0.26$	$0.27 \le S_S \le 0.29$	$0.30 \le S_S \le 0.32$	$0.33 \le S_S \le 0.35$	$0.36 \le S_S \le 0.38$	$S_S \ge 0.39$
A	0.8	0.8	0.8	0.8	0.8	0.8

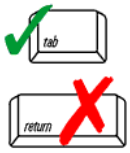
Checklist for Stormwater Report

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

A. Introduction

Important: When filling out forms on the computer, use only the tab key to move your cursor - do not use the return key.



A Stormwater Report must be submitted with the Notice of Intent permit application to document compliance with the Stormwater Management Standards. The following checklist is NOT a substitute for the Stormwater Report (which should provide more substantive and detailed information) but is offered here as a tool to help the applicant organize their Stormwater Management documentation for their Report and for the reviewer to assess this information in a consistent format. As noted in the Checklist, the Stormwater Report must contain the engineering computations and supporting information set forth in Volume 3 of the Massachusetts Stormwater Handbook. The Stormwater Report must be prepared and certified by a Registered Professional Engineer (RPE) licensed in the Commonwealth.

The Stormwater Report must include:

- The Stormwater Checklist completed and stamped by a Registered Professional Engineer (see page 2) that certifies that the Stormwater Report contains all required submittals.[1] This Checklist is to be used as the cover for the completed Stormwater Report.
- Applicant/Project Name
- Project Address
- Name of Firm and Registered Professional Engineer that prepared the Report
- Long-Term Pollution Prevention Plan required by Standards 4-6
- Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan required by Standard 8[2]
- Operation and Maintenance Plan required by Standard 9

In addition to all plans and supporting information, the Stormwater Report must include a brief narrative describing stormwater management practices, including environmentally sensitive site design and LID techniques, along with a diagram depicting runoff through the proposed BMP treatment train. Plans are required to show existing and proposed conditions, identify all wetland resource areas, NRCS soil types, critical areas, Land Uses with Higher Potential Pollutant Loads (LUHPPL), and any areas on the site where infiltration rate is greater than 2.4 inches per hour. The Plans shall identify the drainage areas for both existing and proposed conditions at a scale that enables verification of supporting calculations.

As noted in the Checklist, the Stormwater Management Report shall document compliance with each of the Stormwater Management Standards as provided in the Massachusetts Stormwater Handbook. The soils evaluation and calculations shall be done using the methodologies set forth in Volume 3 of the Massachusetts Stormwater Handbook.

To ensure that the Stormwater Report is complete, applicants are required to fill in the Stormwater Report Checklist by checking the box to indicate that the specified information has been included in the Stormwater Report. If any of the information specified in the checklist has not been submitted, the applicant must provide an explanation. The completed Stormwater Report Checklist and Certification must be submitted with the Stormwater Report.

[1] The Stormwater Report may also include the Illicit Discharge Compliance Statement required by Standard 10. If not included in the Stormwater Report, the Illicit Discharge Compliance Statement must be submitted prior to the discharge of stormwater runoff to the post-construction best management practices.

[2] For some complex projects, it may not be possible to include the Construction Period Erosion and Sedimentation Control Plan in the Stormwater Report. In that event, the issuing authority has the discretion to issue an Order of Conditions that approves the project and includes a condition requiring the proponent to submit the Construction Period Erosion and Sedimentation Control Plan before commencing any land disturbance activity on the site.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

B. Stormwater Checklist and Certification

The following checklist is intended to serve as a guide for applicants as to the elements that ordinarily need to be addressed in a complete Stormwater Report. The checklist is also intended to provide conservation commissions and other reviewing authorities with a summary of the components necessary for a comprehensive Stormwater Report that addresses the ten Stormwater Standards.

Note: Because stormwater requirements vary from project to project, it is possible that a complete Stormwater Report may not include information on some of the subjects specified in the Checklist. If it is determined that a specific item does not apply to the project under review, please note that the item is not applicable (N.A.) and provide the reasons for that determination.

A complete checklist must include the Certification set forth below signed by the Registered Professional Engineer who prepared the Stormwater Report.

Registered Professional Engineer's Certification

I have reviewed the Stormwater Report, including the soil evaluation, computations, Long-term Pollution Prevention Plan, the Construction Period Erosion and Sedimentation Control Plan (if included), the Long-term Post-Construction Operation and Maintenance Plan, the Illicit Discharge Compliance Statement (if included) and the plans showing the stormwater management system, and have determined that they have been prepared in accordance with the requirements of the Stormwater Management Standards as further elaborated by the Massachusetts Stormwater Handbook. I have also determined that the information presented in the Stormwater Checklist is accurate and that the information presented in the Stormwater Report accurately reflects conditions at the site as of the date of this permit application.

Registered Professional Engineer Block and Signature

Signature and Date

Checklist

Project Type: Is the application for new development, redevelopment, or a mix of new and redevelopment?

☒ New development

☐ Redevelopment

☐ Mix of New Development and Redevelopment

Checklist for Stormwater Report

Checklist (continued)

LID Measures: Stormwater Standards require LID measures to be considered. Document what environmentally sensitive design and LID Techniques were considered during the planning and design of the project:

☐ No disturbance to any Wetland Resource Areas

☐ Site Design Practices (e.g. clustered development, reduced frontage setbacks)

☐ Reduced Impervious Area (Redevelopment Only)

☒ Minimizing disturbance to existing trees and shrubs

☐ LID Site Design Credit Requested:

- ☐ Credit 1
- ☐ Credit 2
- ☐ Credit 3

☒ Use of "country drainage" versus curb and gutter conveyance and pipe

☒ Bioretention Cells (includes Rain Gardens)

☐ Constructed Stormwater Wetlands (includes Gravel Wetlands designs)

☐ Treebox Filter

☐ Water Quality Swale

☒ Grass Channel

☐ Green Roof

☐ Other (describe): _____

Standard 1: No New Untreated Discharges

☒ No new untreated discharges

☐ Outlets have been designed so there is no erosion or scour to wetlands and waters of the Commonwealth

☐ Supporting calculations specified in Volume 3 of the Massachusetts Stormwater Handbook included.

Checklist for Stormwater Report

Checklist (continued)

Standard 2: Peak Rate Attenuation

☐ Standard 2 waiver requested because the project is located in land subject to coastal storm flowage and stormwater discharge is to a wetland subject to coastal flooding.

☐ Evaluation provided to determine whether off-site flooding increases during the 100-year 24-hour storm.

☒ Calculations provided to show that post-development peak discharge rates do not exceed pre-development rates for the 2-year and 10-year 24-hour storms. If evaluation shows that off-site flooding increases during the 100-year 24-hour storm, calculations are also provided to show that post-development peak discharge rates do not exceed pre-development rates for the 100-year 24-hour storm.

Standard 3: Recharge

☐ Soil Analysis provided.

☒ Required Recharge Volume calculation provided.

☐ Required Recharge volume reduced through use of the LID site Design Credits.

☒ Sizing the infiltration, BMPs is based on the following method: Check the method used.

☒ Static ☐ Simple Dynamic ☐ Dynamic Field[1]

☒ Runoff from all impervious areas at the site discharging to the infiltration BMP.

☐ Runoff from all impervious areas at the site is *not* discharging to the infiltration BMP and calculations are provided showing that the drainage area contributing runoff to the infiltration BMPs is sufficient to generate the required recharge volume.

☒ Recharge BMPs have been sized to infiltrate the Required Recharge Volume.

☐ Recharge BMPs have been sized to infiltrate the Required Recharge Volume *only* to the maximum extent practicable for the following reason:

- ☐ Site is comprised solely of C and D soils and/or bedrock at the land surface
- ☐ M.G.L. c. 21E sites pursuant to 310 CMR 40.0000
- ☐ Solid Waste Landfill pursuant to 310 CMR 19.000
- ☐ Project is otherwise subject to Stormwater Management Standards only to the maximum extent practicable.

☒ Calculations showing that the infiltration BMPs will drain in 72 hours are provided.

☐ Property includes a M.G.L. c. 21E site or a solid waste landfill and a mounding analysis is included.

[1] 80% TSS removal is required prior to discharge to infiltration BMP if Dynamic Field method is used.

Checklist for Stormwater Report

Checklist (continued)

Standard 3: Recharge (continued)

☐ The infiltration BMP is used to attenuate peak flows during storms greater than or equal to the 10-year 24-hour storm and separation to seasonal high groundwater is less than 4 feet and a mounding analysis is provided.

☐ Documentation is provided showing that infiltration BMPs do not adversely impact nearby wetland resource areas.

Standard 4: Water Quality

The Long-Term Pollution Prevention Plan typically includes the following:

- Good housekeeping practices;
- Provisions for storing materials and waste products inside or under cover;
- Vehicle washing controls;
- Requirements for routine inspections and maintenance of stormwater BMPs;
- Spill prevention and response plans;
- Provisions for maintenance of lawns, gardens, and other landscaped areas;
- Requirements for storage and use of fertilizers, herbicides, and pesticides;
- Pet waste management provisions;
- Provisions for operation and management of septic systems;
- Provisions for solid waste management;
- Snow disposal and plowing plans relative to Wetland Resource Areas;
- Winter Road Salt and/or Sand Use and Storage restrictions;
- Street sweeping schedules;
- Provisions for prevention of illicit discharges to the stormwater management system;
- Documentation that Stormwater BMPs are designed to provide for shutdown and containment in the event of a spill or discharges to or near critical areas or from LUHPPL;
- Training for staff or personnel involved with implementing Long-Term Pollution Prevention Plan;
- List of Emergency contacts for implementing Long-Term Pollution Prevention Plan.

☐ A Long-Term Pollution Prevention Plan is attached to Stormwater Report and is included as an attachment to the Wetlands Notice of Intent.

☐ Treatment BMPs subject to the 44% TSS removal pretreatment requirement and the one inch rule for calculating the water quality volume are included, and discharge:

- ☐ is within the Zone II or Interim Wellhead Protection Area
- ☐ is near or to other critical areas
- ☐ is within soils with a rapid infiltration rate (greater than 2.4 inches per hour)
- ☐ involves runoff from land uses with higher potential pollutant loads.

☐ The Required Water Quality Volume is reduced through use of the LID site Design Credits.

☒ Calculations documenting that the treatment train meets the 80% TSS removal requirement and, if applicable, the 44% TSS removal pretreatment requirement, are provided.

Checklist for Stormwater Report

Checklist (continued)

Standard 4: Water Quality (continued)

☐ The BMP is sized (and calculations provided) based on:

☒ The ½" or 1" Water Quality Volume or

☐ The equivalent flow rate associated with the Water Quality Volume and documentation is provided showing that the BMP treats the required water quality volume.

☐ The applicant proposes to use proprietary BMPs, and documentation supporting use of proprietary BMP and proposed TSS removal rate is provided. This documentation may be in the form of the propriety BMP checklist found in Volume 2, Chapter 4 of the Massachusetts Stormwater Handbook and submitting copies of the TARP Report, STEP Report, and/or other third party studies verifying performance of the proprietary BMPs.

☐ A TMDL exists that indicates a need to reduce pollutants other than TSS and documentation showing that the BMPs selected are consistent with the TMDL is provided.

Standard 5: Land Uses With Higher Potential Pollutant Loads (LUHPPLs)

☐ The NPDES Multi-Sector General Permit covers the land use and the Stormwater Pollution Prevention Plan (SWPPP) has been included with the Stormwater Report.

☒ The NPDES Multi-Sector General Permit covers the land use and the SWPPP will be submitted ***prior to*** the discharge of stormwater to the post-construction stormwater BMPs.

☐ The NPDES Multi-Sector General Permit does ***not*** cover the land use.

☐ LUHPPLs are located at the site and industry specific source control and pollution prevention measures have been proposed to reduce or eliminate the exposure of LUHPPLs to rain, snow, snow melt and runoff, and been included in the long term Pollution Prevention Plan.

☐ All exposure has been eliminated.

☐ All exposure has ***not*** been eliminated and all BMPs selected are on MassDEP LUHPPL list.

☐ The LUHPPL has the potential to generate runoff with moderate to higher concentrations of oil and grease (e.g. all parking lots with >1000 vehicle trips per day) and the treatment train includes an oil grit separator, a filtering bioretention area, a sand filter or equivalent.

Standard 6: Critical Areas

☐ The discharge is near or to a critical area and the treatment train includes only BMPs that MassDEP has approved for stormwater discharges to or near that particular class of critical area.

☐ Critical areas and BMPs are identified in the Stormwater Report.

Checklist for Stormwater Report

Checklist (continued)

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the maximum extent practicable

☐ The project is subject to the Stormwater Management Standards only to the maximum Extent Practicable as a:

- ☐ Limited Project
- ☐ Small Residential Projects: 5-9 single family houses or 5-9 units in a multi-family development provided there is no discharge that may potentially affect a critical area.
- ☐ Small Residential Projects: 2-4 single family houses or 2-4 units in a multi-family development with a discharge to a critical area
- ☐ Marina and/or boatyard provided the hull painting, service and maintenance areas are protected from exposure to rain, snow, snow melt and runoff
- ☐ Bike Path and/or Foot Path
- ☐ Redevelopment Project
- ☐ Redevelopment portion of mix of new and redevelopment.

☐ Certain standards are not fully met (Standard No. 1, 8, 9, and 10 must always be fully met) and an explanation of why these standards are not met is contained in the Stormwater Report.

☐ The project involves redevelopment and a description of all measures that have been taken to improve existing conditions is provided in the Stormwater Report. The redevelopment checklist found in Volume 2 Chapter 3 of the Massachusetts Stormwater Handbook may be used to document that the proposed stormwater management system (a) complies with Standards 2, 3 and the pretreatment and structural BMP requirements of Standards 4-6 to the maximum extent practicable and (b) improves existing conditions.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control

A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan must include the following information:

- Narrative;
- Construction Period Operation and Maintenance Plan;
- Names of Persons or Entity Responsible for Plan Compliance;
- Construction Period Pollution Prevention Measures;
- Erosion and Sedimentation Control Plan Drawings;
- Detail drawings and specifications for erosion control BMPs, including sizing calculations;
- Vegetation Planning;
- Site Development Plan;
- Construction Sequencing Plan;
- Sequencing of Erosion and Sedimentation Controls;
- Operation and Maintenance of Erosion and Sedimentation Controls;
- Inspection Schedule;
- Maintenance Schedule;
- Inspection and Maintenance Log Form.

☒ A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan containing the information set forth above has been included in the Stormwater Report.

Checklist for Stormwater Report

Checklist (continued)

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control (continued)

☐ The project is highly complex and information is included in the Stormwater Report that explains why it is not possible to submit the Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan with the application. A Construction Period Pollution Prevention and Erosion and Sedimentation Control has ***not*** been included in the Stormwater Report but will be submitted ***before*** land disturbance begins.

☐ The project is ***not*** covered by a NPDES Construction General Permit.

☐ The project is covered by a NPDES Construction General Permit and a copy of the SWPPP is in the Stormwater Report.

☒ The project is covered by a NPDES Construction General Permit but no SWPPP been submitted. The SWPPP will be submitted BEFORE land disturbance begins.

Standard 9: Operation and Maintenance Plan

☒ The Post Construction Operation and Maintenance Plan is included in the Stormwater Report and includes the following information:

- ☐ Name of the stormwater management system owners;
- ☐ Party responsible for operation and maintenance;
- ☐ Schedule for implementation of routine and non-routine maintenance tasks;
- ☐ Plan showing the location of all stormwater BMPs maintenance access areas;
- ☐ Description and delineation of public safety features;
- ☐ Estimated operation and maintenance budget; and
- ☐ Operation and Maintenance Log Form.

☐ The responsible party is ***not*** the owner of the parcel where the BMP is located and the Stormwater Report includes the following submissions:

- ☐ A copy of the legal instrument (deed, homeowner's association, utility trust or other legal entity) that establishes the terms of and legal responsibility for the operation and maintenance of the project site stormwater BMPs;
- ☐ A plan and easement deed that allows site access for the legal entity to operate and maintain BMP functions.

Standard 10: Prohibition of Illicit Discharges

☒ The Long-Term Pollution Prevention Plan includes measures to prevent illicit discharges;

☐ An Illicit Discharge Compliance Statement is attached;

☐ NO Illicit Discharge Compliance Statement is attached but will be submitted ***prior to*** the discharge of any stormwater to post-construction BMPs.

Stormwater Report Narrative

This Stormwater Report has been prepared to demonstrate compliance with the Massachusetts Stormwater Management Standards in accordance with the Massachusetts Wetlands Protection Act Regulations (310 CMR 10.00) and Water Quality Certification Regulations (314 CMR 9.00).

Project Description

The Applicant, MassDOT, is proposing to construct a commuter rail station along the existing Fall River Secondary tracks in Freetown, Massachusetts (the Project). As proposed, the Project requires the acquisition of approximately 7 acres of land at 165 South Main Street of which approximately 4 acres will be developed for the new station. The Project will involve a platform with canopy, ancillary landscape improvements, 173 parking spaces, a pick up/drop off area, bicycle parking facilities, and utility improvements to support this use.

The station is not considered a Land Use with Higher Potential Pollutant Loads (LUHPPL) as defined in 3.10 CMR 10.04 and 314 CMR 9.02 because it is not a parking lot with a high-intensity use (1,000 vehicle trips per day or more).

Site Description

The project development area (the Site) consists of approximately 4 acres of currently undeveloped land (see Figures 1 and 2). The Site is bound by Assonet Mini Storage to the west, South Main Street to the northwest, woods and wetlands to the north, grassed pasture to the northeast, the Fall River Secondary tracks to the southeast, and woods and wetlands to the southwest. A telecommunications tower abuts the mini storage and is in the southwest corner of the Site. Brightman Lumber Co. is located nearby south of the Site and the Stop and Shop Distribution Center is located to the north, across South Main Street. See Figure 1, Site Locus Map and Figure 2, Site Aerial.

The wetland Resource Areas on the Site as, shown on Figures 3 and 4, are described in Table 1. The wetlands ultimately flow to the Taunton River. For additional information regarding the wetland resource areas present on the site see the Abbreviated Notice of Resource Area Delineation (ANRAD) prepared by VHB dated January 2012.

Table 1
Wetland Resource Areas

Name	*Critical Area*	*Zone 1 or Zone A*	*ORW or SRW*	*Zone II or IWPA*	*Description*
Wetland 1	No	No	No	No	PFO
Wetland 1A	No	No	No	No	PEM

Notes: Wetland Classifications: PEM = Palustrine Emergent, PFO = Palustrine Forested

According to the National Resources Conservation Service (NRCS), surface soils on the Site include Merrimac fine sandy loam, Scarboro muck, Ridgebury fine sandy loam, and Sudbury fine sandy loam, and are classified as Hydrologic Soil Groups (HSG) A, D, C, B, respectively. The majority of the soil on the Site is classified as HSG A. Based on the soil evaluation included in Appendix C, the Site is considered to be within an area of rapid infiltration (soils with a saturated hydraulic conductivity greater than 2.4 inches per hour. According to 1982 Rawls Rates, infiltration rates for the soils will be approximately 2.41 inches per hour.).

The project is not located within the 100-year flood plain as shown on FEMA Floodway Map, Town of Freetown, Massachusetts Bristol County, Community Panel numbers 25005C0263F and 25005C0264F dated July 7, 2009, included in Appendix B.

Existing Drainage Conditions

Under existing conditions, the Site consists of mostly cleared, but undeveloped land. The Site is primarily grass pasture and dirt with some dirt mounds and a few scattered trees. There is also a gravel road that goes around the mini storage to provide access to the communications tower. For existing conditions hydrologic analysis, the drainage area including the Site and the mini storage was divided into four sub drainage areas. The existing mini storage was included because site drainage flows on to this property under current conditions. All four drainage areas contribute to a single design point (Wetland 1). The following is a summary of each drainage area.

Drainage Area 1 – This 2.45-acre area comprises the portion of the Site between the mini storage lot and Wetland 1, extending from South Main Street to the existing Fall River Line track. The area consists of grassy pasture with some areas of dirt, gravel, and brush. Runoff from Drainage Area 1 sheet flows in a northerly direction to Wetland 1, on the north side of the Site.

Drainage Area 2 – This 0.95-acre area consist of grassy pasture with some sections of dirt, gravel, and brush. The area is located in the center of the Site, between the Fall River Line track and the mini storage. Runoff from this area sheet flows into Drainage Area 3 and sheet flows across the gravel lot. Runoff from Drainage Area 2 flows to Wetland 1.

Drainage Area 3 – This 3.34-acre area consists of the developed land that the Assonet Mini Storage occupies. The area is split between a paved portion with storage buildings, a gravel lot, and some grassed sections along South Main Street. There is a drainage system for paved area, while the gravel lot and grassed area sheet flows, untreated, to Wetland 1.

Drainage Area 4 – This 1.79-acre area consist of grassy pasture with some sections of dirt, gravel, and brush. The area is located on the south side of the Site, between the Fall River Line track and the mini storage. Runoff from this area sheet flows into Drainage Area 3 and is captured by the drainage system. Runoff from Drainage Area 4 flows to Wetland 1.

Figure 3 illustrates the existing drainage patterns on the Site. Table 2 below provides a summary of the existing conditions hydrologic data.

Table 2
Existing Conditions Hydrologic Data

Drainage Area	*Discharge Location*	*Design Point*	*Area (acres)*	*Curve Number*	*Time of Concentration (min)*
1	Wetland 1	1	2.45	51	6.9
2	Wetland 1	1	0.95	42	8.5
3	Wetland 1	1	3.34	89	5.0
4	Wetland 1	1	1.79	71	7.4

Proposed Drainage Conditions

Figure 4 illustrates the proposed "post construction" drainage conditions for the project. As shown, the Site will be divided into five drainage areas that discharge treated stormwater to the one existing Design Point. Existing drainage and grading patterns were maintained to the maximum extent possible. The drainage from the paved areas will be captured and treated in three infiltration basins. These basins are designed to decentralize stormwater management and reduce peak runoff rates, maximize groundwater recharge and treat for water quality. The following is a summary of each drainage area.

Drainage Area 1 – This 0.99-acre area comprises the eastern portion of the parking lot and consists of a paved parking area for the station, grassed swale, and Infiltration Basin 1 to the east of the parking. Runoff from Drainage Area 1 is directed to Basin 1, which discharges to Wetland 1.

Drainage Area 2 – This 1.70-acre area in the southern portion of the Site consists of grassy pasture with some sections of dirt, gravel, and brush. The majority of Drainage Area 2 is unchanged from existing conditions. Part of the area will remain occupied by an existing telecommunications tower and gravel access drive. Runoff from Drainage Area 2 sheet flows to Drainage Area 3, the existing mini storage area, where is it captured by the existing drainage system and discharged to Wetland 1.

Drainage Area 3 – This 3.50-acre area comprises the existing mini storage area. Runoff from Drainage Area 3 discharges to Wetland 1.

Drainage Area 4 – This 0.71-acre area comprises the site access road and consists of a paved roadway, grassed swale, and Infiltration Basin 3 to the northeast of the roadway. Runoff from Drainage Area 4 is directed a grassed swale that leads to a sediment forebay and Basin 3, which discharges to Wetland 1.

Drainage Area 5 – This 1.63-acre area comprises the southwestern portion of the parking lot and consists of a paved parking area for the station, grassed swale, and Infiltration Basin 2 to the northeast of the parking. Runoff from Drainage Area 5 is directed to a swale, then through a pipe under the access drive to Basin 2, which discharges to Wetland 1.

Table 3 below provides a summary of the proposed conditions hydrologic data.

Table 3
Proposed Conditions Hydrologic Data

Drainage Area	*Discharge Location*	*Design Point*	*Area (acres)*	*Curve Number*	*Time of Concentration (min)*
1	Wetland 1	1	0.99	83	5.0
2	Wetland 1	1	1.70	71	7.4
3	Wetland 1	1	3.50	87	5.0
4	Wetland 1	1	0.71	90	5.0
5	Wetland 1	1	1.63	83	5.0

The site has been designed with a comprehensive stormwater management system in accordance with the Massachusetts Stormwater Handbook. The proposed

stormwater management system has been designed to treat the half inch Water Quality Volume.

Environmentally Sensitive and Low Impact Development (LID) Techniques

Low Impact Development (LID) techniques and stormwater Best Management Practices (BMPs) implemented into the site design include:

- Minimal disturbance to existing trees and vegetation
- Infiltration basins
- Light colored pavement sidewalks
- Grassed swales

In general, stormwater runoff from impervious surfaces in the proposed drainage areas will receive treatment for stormwater quality in grassed swales and infiltration basins prior to discharge to the existing design point.

Hydraulic Analysis

The closed drainage system was designed for the 25-year storm event, in accordance with the Massachusetts Bay Transportation Authority, Railroad Operations, Commuter Rail Design Standards Manual, Volume 1.

Drainage pipes were sized using Manning's Equation for full-flow capacity and the Rational Method. Pipe sizing calculations are included in Appendix A of this report.

Regulatory Compliance

Massachusetts Department of Environmental Protection (DEP) - Stormwater Management Standards

As demonstrated below, the proposed Project fully complies with the DEP Stormwater Management Standards at 310 CMR 10.05.

Standard 1: No New Untreated Discharges or Erosion to Wetlands

The Project has been designed to fully comply with Standard 1.

The Best Management Practices (BMPs) included in the proposed stormwater management system have been designed in accordance with the Massachusetts Stormwater Handbook. Supporting information and computations demonstrating that no new untreated discharges will result from the Project are presented through compliance with Standards 4 through 6.

All proposed Project stormwater outlets and conveyances have been designed to not cause erosion or scour to wetlands or receiving waters. Outlets from closed drainage systems have been designed with flared end sections and stone protection to dissipate discharge velocities. Overflows from BMPs that impound stormwater have been designed with stone to protect down gradient areas from erosion.

Computations and supporting information for the sizing and selection of materials used to protect from scour and erosion are included in Appendix A.

Standard 2: Peak Rate Attenuation

The Project has been designed to fully comply with Standard 2.

The rainfall-runoff response of the Site under existing and proposed conditions was analyzed for storm events with recurrence intervals of 2, 10, and 100-years. The results of the analysis, as summarized in Table 4 below, indicate that there is no increase in peak discharge rates between the existing and proposed conditions.

Computations and supporting information regarding the hydrologic modeling are included in Appendix B.

Table 4
Peak Discharge Rates (cfs*)

Design Point	*2-year*	*10-year*	*100-year*
Design Point 1: Wetland 1			
Existing	10.8	18.3	33.4
Proposed	10.4	17.3	31.8

Standard 3: Stormwater Recharge

The Project has been designed to fully comply with Standard 3.

In accordance with the Stormwater Handbook, the Required Recharge Volume for the Project is 4,676 cubic feet.

Recharge of stormwater has been provided through the use of infiltration basins, which has been sized using the static method. Each infiltration BMP has been designed to drain completely within 72 hours. Table 5 below provides a summary of the proposed infiltration BMPs utilized for the Project.

Table 5
Summary of Recharge Calculations

Infiltration BMP	*Provided Recharge Volume (cubic feet)*
Infiltration Basin P1	1,955
Infiltration Basin P2	5,205
Infiltration Basin P3	4,403
Total Provided Recharge	11,563

A Geotechnical Report is included in Appendix E.

Standard 4: Water Quality

The Project has been designed to fully comply with Standard 4.

The proposed stormwater management system implements a treatment train of BMPs that has been designed to provide a minimum of 80% TSS removal for stormwater runoff from all proposed impervious surfaces.

Computations and supporting information are included in Appendix D.

Standard 5: Land Uses with Higher Potential Pollutant Loads (LUHPPLs)

The site is not considered a LUHPPL as defined in 3.10 CMR 10.04 and 314 CMR 9.02 because the parking lot is not classified as a high-intensity use (1,000 vehicle trips per day or more).

Standard 6: Critical Areas

The Project will not discharge stormwater near or to a critical area.

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the Maximum Extent Practicable

The Project is not a redevelopment.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Controls

The Project would disturb approximately 3.9 acres of land and is therefore required to obtain coverage under the Environmental Protection Agency (EPA) National Pollutant Discharge Elimination System (NPDES) Construction General Permit (CGP). As required under this permit, a Stormwater Pollution Prevention Plan (SWPPP) would be developed and a Notice of Intent for the CGP would be submitted by the contractor and owner at least 14 days before land disturbance begins. Recommended construction period pollution prevention and erosion and sedimentation controls were discussed in the DEIR/S. Appropriate controls will be prepared and implemented by the contractor and MassDOT (MBTA) during construction in accordance with the final design and NPDES SWPPP.

Standard 9: Operation and Maintenance Plan

In compliance with Standard 9, a Post Construction Stormwater Operation and Maintenance (O&M) Plan will be developed by the MBTA during final design for the Project.

Standard 10: Prohibition of Illicit Discharges

The site was previously undeveloped and no sanitary sewer or storm drainage infrastructure is known to exist on the site. The design plans submitted with this report have been designed in full compliance with current standards. The Long-Term Pollution Prevention Plan will include measures to prevent illicit discharges.

Appendix B
Standard 2 Computations and Supporting Information

Rainfall volumes used for this analysis were based on the Natural Resources Conservation Service (NRCS) Type III, 24-hour storm event for Bristol County. Runoff coefficients for the existing and proposed conditions, as previously shown in Tables 1 and 2 respectively, were determined using NRCS Technical Release 55 (TR-55) methodology as provided in HydroCAD. The HydroCAD model is based on the NRCS Technical Release 20 (TR-20) Model for Project Formulation Hydrology.

MAP INFORMATION

Map Scale: 1:2,200 if printed on A size (8.5" × 11") sheet.

The soil surveys that comprise your AOI were mapped at 1:20,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for accurate map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: UTM Zone 19N NAD83

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Bristol County, Massachusetts, Southern Part
Survey Area Data: Version 6, Jul 23, 2010

Date(s) aerial images were photographed: 8/14/2003

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Geotechnical Report

JACOBS™
343 Congress Street
Boston, MA 02210

Design Memorandum

Date	January 31, 2012
To	Rick Carey, Natasha Velickovic - VHB
From	Paul Murphy, Da Ha, Peter Chou - Jacobs
Subject	MBTA South Coast Rail (New Bedford/Fall River Commuter Rail Extension) Freetown Station Geotechnical Design Memorandum Freetown, MA
Project No.	E2347101

INTRODUCTION

The South Coast Rail project will restore passenger rail transportation from South Station in Boston to the cities of Fall River and New Bedford along an existing rail freight corridor running south from Taunton to Fall River and New Bedford. The project will include the construction of several existing and new passenger stations and two terminal layover facilities. This geotechnical design memorandum presents the foundation design considerations for the new station platform at the proposed Freetown Station in Freetown, Massachusetts. The design recommendations presented in this report are based on the results of subsurface investigations performed by Jacobs in 2001 and 2010.

Existing Conditions

The proposed Freetown Station site is located off the south side of South Main Street in Freetown (Figure 1). The site is currently an undeveloped gravel lot with associated soil stockpiles on the site and some wetland areas are also present adjacent to the platform area. A self-storage facility with associated parking is located along the north side of the site, a telecommunication tower is located west of the site, and the remaining site area is surrounded by open and forested land. Existing grades at the platform location range from approximately elevation 61 to 67.6 feet (NGVD29 Datum), generally sloping downward from west to east.

Proposed Construction

Current station plans are to construct a new parking area, a new drop-off area, and an 800 foot long, 12 foot wide high level platform adjacent to the existing tracks. In addition, some track relocation is required. Access to the platform will be from a new ramp/stair structure along the north side of the tracks. Two 50-ft long platform canopies are also planned. The details of new track layout (including grading), associated sidewalks and ramps, and parking lot of the proposed station are still under development at the time of this report preparation. However, we anticipate that about 6 to 8 feet of fill is proposed at the site to raise the grade at the track level and platform area. This report focuses on the geotechnical design and recommendation for the platform only.

SCOPE OF WORK

This memorandum was prepared by Jacobs in accordance with the scope of work under the contract between Jacobs and VHB for work on the New Bedford/Fall River Commuter Rail Line Extension Project for Massachusetts Bay Transportation Authority (MBTA). The geotechnical work included the following tasks:

- Perform a geotechnical exploration and laboratory testing program;
- Report and interpret the results of the exploration and laboratory testing program; and
- Provide geotechnical recommendations for design and construction of the platform foundations.

The Jacobs scope of work did not include environmental assessment of the potential presence of any hazardous materials at the project site or potential impacts to adjacent structures during construction.

LOCAL GEOLOGY

The geologic map of Massachusetts shows the Freetown Station to be located in the Milford-Dedham zone, just south of the Narragansett Basin. The bedrock in the Milford-Dedham zone is mostly granite of Proterozoic age. The bedrock in the Narragansett Basin is lightly metamorphosed shale and sandstone of Pennsylvanian and Permian age. Bedrock was not sampled at the Freetown site. Two of the borings encountered SPT refusal at a depth of 47 and 48 feet, but the refusal could possibly be a large boulder or true bedrock. The deepest boring at the site extended to a depth of 49 feet. The bedrock is typically overlain by hard till or very dense sand and gravel.

GEOTECHNICAL EXPLORATIONS

Jacobs planned the subsurface exploration programs and retained the drilling contractors to perform the explorations. The geotechnical data reports were submitted in 2001 and 2010, respectively. Nine borings (FTS-1, FTS-4, FTS-5 to FTS-8, FR-79 MW, FR-80 and FR-81) were conducted along the proposed station platform and nine borings (FTS-09 to FTS-17) were drilled in the general vicinity of the proposed parking lot and the access road. Boring locations are shown on the Subsurface Exploration Plan (Figure 2).

The recent 2010 borings were drilled by New Hampshire Boring with either a CME-550 or D-50 ATV mounted drill rig. The 2001 borings were drilled by Earth Explorations, Inc. and NFE, Inc. with a B-57 ATV mounted drill rig. The 2010 borings were advanced through the soil by hollow-stem auger or wash boring methods using a 4-inch casing and roller bit with water. Standard penetration tests (SPT), consisting of 140-pound hammer dropping 30 inches on a standard 2-inch-diameter (OD) split-spoon sampler, were performed with a safety hammer to establish the consistency of the subsurface soils. The SPT's were typically performed at five foot intervals of depth. The obtained samples were sealed in glass jars to retain their natural moisture. Bedrock was not cored during the explorations. (Borings performed in 2001 were summarized in our previous data reports.)

The borings were observed by a representative from Jacobs. The soil samples were classified in the field in accordance with ASTM D2488, Standard Practice for Description and Identification of Soils (Visual-Manual Procedure) by Jacobs' representative, and appropriate stratum breaks were interpolated from drilling and sampling observations. The boring logs were prepared by Jacobs based on the field classifications and laboratory testing, and are presented in Appendix A.

LABORATORY TESTING

The results of the laboratory testing were previously submitted to VHB in reports entitled "South Coast Rail, Jacobs Geotechnical Data Report", dated November 2010, and "Fall River Line, Jacobs Geotechnical Data Report", dated October 2001.

Grain size distribution analyses were performed to evaluate the gradation of the natural granular soils for potential reuse as backfill, if needed, and to classify the soils. The graduation analyses are summarized in Table 1 below and are presented in Appendix B.

Table 1: Laboratory Soil Classification Summary

BORING NO.	SAMPLE NO.	ELEVATION (FEET)	USCS SOIL CLASSIFICATION	W (%)	GRAVEL (%)	SAND (%)	FINES (%)	ORGANIC CONTENT (%)
FTS-04	S2	63.6	moist, black Silt (ML)	42.4	NT	NT	NT	4.7
FTS-11	S1	55.0	Sandy Silt (ML)	24	0	48.1	51.9	NT
FTS-13	S2	34.6	Silt (ML)	23.8	0	1.0	99.0	NT

Where: w = natural moisture content, NT = Not Tested

SUBSURFACE CONDITIONS

The subsurface conditions at the site were inferred from the boring data collected for the South Coast Rail project, with some interpretations. The subsurface conditions encountered at the station area during our 2001 and 2010 explorations generally consist of a layer of granular fill with thickness of about 0 to 3 feet, underlain by natural, loose to dense stratified silt and sand deposits, and very dense glacial till. Boulders were encountered at borings FTS-1 and FTS-6 at depths of 31 feet and 24 feet below ground surface, respectively. Apparent bedrock was encountered at a depth of about 48 feet (El. 14.2 feet) in boring FTS-1 and at a depth of about 45 feet (El. 20.6 feet) in boring FTS-4.

Organic silt was encountered at boring FTS-4 along the proposed platform at a depth of 3 to 5 feet (elevations 64.6 to 62.6 feet).

Fill materials with thicknesses varying from 0 to 7 feet were also encountered in the vicinity of the proposed parking lot area. Bedrock was not encountered in this area.

Subsurface soil conditions are summarized in Table 2 below.

Table 2: Summary of Subsurface Conditions at Borings

BORING NUMBER	GROUND SURFACE ELEV. (FT)	APPROX. FILL THICKNESS (FT)	TOP OF NATURAL SOIL ELEV. (FT)	APPROX. TOP OF ROCK ELEV. (FT)	BOTTOM OF BORING ELEV. (FT)	APPROX. GROUND WATER ELEV. (FT)	REMARKS

FTS – 17	60.7	0	60.7	NE	35.7	50.7	Auger Boring
NE: Not encountered at the boring during drilling.							

Fill: The fill layer, where encountered, typically consists of railroad ballast, and granular, loose to medium dense sand and gravel. Clay fill was encountered at boring FR-81. The fill layer is generally about 0 to 3 feet thick in the area of the platform.

Organic Silt: A two foot thick layer of organic silt was encountered from approximately elevation 64.5 to 62.5 feet at boring FTS-4 at the west side of the platform. Boring FTS-4 is located adjacent to a wetland area. Organic soils may also be located near other wetland areas at the site.

Natural Granular Deposits: In the platform area, the natural soil deposits below the fill generally consist of predominantly silt, sandy silt and silty sand with up to 30% gravel. These deposits are loose to very dense with Standard Penetration Test (SPT) N-values ranging between 6 and 58 blows per foot (bpf).

Glacial Till: Very dense glacial till was encountered in the platform area at elevations ranging from 31.4 to 40.6 feet, and consisted of silt with 10 to 30% sand and 10 to 20% gravel.

Groundwater: Groundwater levels were measured in the test borings using a weighted tape during and at completion of drilling. The data indicated the groundwater level ranged from approximate elevations 49 to 62.6 feet along the platform alignment, and from elevations 35.6 to 54 feet in the general site area. The use of wash boring techniques for some of the borings may have artificially increased the water level readings due to the addition of water to the borings. Trapped/perched water is also commonly seen at a higher elevation within existing fill and silty materials. The longer term water level readings taken at boring FTS–09 OW on July 7, 2010 and September 13, 2011 indicated the groundwater at a depth of about 6 feet (elevation 51.6 feet) and 5 feet (elevation 52.6 feet), respectively. The longer term readings taken at borings FTS–15 OW and FTS–16 OW on July 7, 2010 indicated groundwater at a depth of about 8 feet (elevation 38.7 feet) and 1.4 feet (elevation 36.2 feet), respectively.

Groundwater levels should be expected to fluctuate with rainfall and other seasonal variations. Local and periodic variations of groundwater elevations may also be influenced by local subsurface drainage and leaking water or sewer pipes. More long-term observations would be required to evaluate true groundwater levels and their influence on planned construction. However, based upon these short-term observations and readings from the observation wells, it is anticipated that the groundwater could be within 5 to 12 feet below

existing grade at the platform area and within 1 to 8 feet below existing grade in the parking lot and roadway area.

GEOTECHNICAL RECOMMENDATIONS

Based on our review of available subsurface conditions, the proposed station platforms can be supported on shallow spread footings bearing directly within either competent natural soil or structural fill placed above suitable natural soils. Platform and canopy design loads were not available at the time of this report preparation. However, it is anticipated that the station platform will be lightly (axially) loaded with limited horizontal forces from wind and seismic loads.

The following paragraphs provide project specific geotechnical recommendations for foundation soil preparation, structural fill/backfill placement, and design and construction of spread footings.

Platform Foundations - Spread Footings

Spread footings are recommended for the platform foundations, bearing on compacted structure fill or natural granular deposits. The bottom of footing elevation should be at least 4 feet below final grades for frost protection. Due to proposed site filling, bottom of footing is anticipated to be at elevations 66 to 70 feet. The existing fill and organic silt deposits are not suitable for support of the spread footings and should be removed within the zone of influence of the footings, defined by a line extending one foot horizontally from the bottom edge of footing and then down and away at a 1H:1V slope until natural soils are encountered.

The recommended allowable design bearing capacity for spread footings bearing on at least medium dense structural fill or natural silt, sandy silt or silty sand deposits is 6 ksf, provided that subgrades are prepared as described herein. This provides an adequate factor of safety against bearing failure and limits the total estimated settlement to less than one inch and the differential settlement to less than ½ inch. All footings should be at least 4 feet wide.

The structural fill material, if needed, should be free from organics and other deleterious substances and should conform to the requirements listed in the MBTA Standard Specification Section 02200 - Earthwork for Type B Gravel Borrow. The structural fill should be compacted to 95% of the maximum dry density as determined by the Modified Proctor compaction test (ASTM D1557).

All temporary open cuts required for footing construction should be in accordance with the related OSHA regulations and should have side slopes of no steeper than 1.5H:1V.

Seismic Consideration

The seismic design should comply with the requirements of the most current Massachusetts State Building Code 780 CMR and other relevant project design codes such as AREMA and AASHTO. Modification of the peak acceleration by the soils overlying bedrock depends upon the type of soil at the site. For the subsurface conditions encountered, the station platform site is classified as Seismic Site Class D soil profile in accordance with 780 CMR Chapter 1614.0 Section 9.4 Site Ground Motion. The structure could be designed for the total lateral seismic force using the equations specified in the code, or by the response spectrum method using the design spectra presented in the code. The maximum considered earthquake ground motions shall be as represented by the spectral response acceleration at short periods (Ss) and at 1-sec (S_1) obtained from Table 1604.10 of the Massachusetts State Building Code and adjusted for Site Class effects using the site coefficients of Section 9.4.1.2.4.

For Site Class D Soils at the location of this station:

S_{MS} = 0.368 and S_{M1} = 0.144

S_{DS} = 0.245 and S_{D1} = 0.096

where:

- S_{MS} is the maximum consider earthquake spectral response acceleration for short periods adjusted for site class
- S_{M1} is the maximum consider earthquake spectral response acceleration at 1-sec adjusted for site class
- S_{DS} is the design earthquake spectral response acceleration for short periods adjusted for site class
- S_{D1} is the design earthquake spectral response acceleration at 1-sec adjusted for site class

The building code also requires that the soil be evaluated for the following potential hazards: slope instability, soil liquefaction, or surface rupture due to faulting or lateral spreading. The proposed grading is relatively flat and we are not aware of any pre-existing slope instability in this area. The existing overburden soils do not appear to be subject to surface rupture due to faulting or lateral spreading.

Liquefaction

Based on the observed subsurface conditions, recorded water levels, percentage of fine contents and sample relative densities, the existing soils underlying the site are judged not susceptible to liquefaction.

CONSTRUCTION CONSIDERATIONS

Foundation Installation - Spread Footings

The existing fill and organic silt should be stripped off and removed from within the zone of influence of the platform and walkway areas down to natural granular deposits using a smooth edge excavation bucket, and replaced by compacted granular soils.

Following excavation to the top of the natural granular deposits, the exposed surface should be observed by an on-site representative of the project geotechnical engineer and be proof-compacted with at least 10 passes of a large vibratory drum roller. Any yielding areas should be observed by geotechnical personnel to assess if localized undercutting is necessary. Footing inspections should include hand auger probes by the geotechnical personnel to check for soft/weak zones. The need for undercutting and backfilling with structural fill should be closely evaluated in the field based on encountered conditions.

In areas where seepage is encountered within footing excavations, the need for placing a 3" thick lean concrete mud mat or a layer of ¾-inch crushed stone to protect the bearing surface should be evaluated in the field. Crushed stone thicker than 4 inches shall be wrapped by non-woven filter fabric.

Following observation of the bearing soils by geotechnical personnel, reinforcing steel and concrete can be placed in the excavation. It is recommended that footing reinforcing steel and concrete be placed the same day as the footing excavation is made, where possible, to avoid significant moisture content changes in the bearing soils. No water should be allowed to pond within excavations and drainage should be maintained

away from foundations both during and after construction. The footing excavation should be free of loose debris at the time of footing concrete placement.

Subgrade Preparation

Prior to performing any required grading operations and excavations in the proposed structure footprints, walkway and paved areas, these areas should be stripped of topsoil, vegetation, fill, organic silt, and existing pavement, if present. The topsoil should be placed in a designated area for reuse during final grading. Following site clearing and stripping, the exposed subgrade should be proof compacted with 10 passes of a large vibratory drum roller (minimum 10,000 pound static weight). Any pockets of excessively soft, wet or disturbed soil or unsuitable soils should be removed and replaced with properly compacted fill materials. Where subgrade soils are close to the existing groundwater level or where silty subgrade soils are encountered, proof-compaction using non-vibratory methods may be considered by the geotechnical engineer.

If additional rolling does not correct the unstable condition, the subgrade should be scarified to a depth of at least six inches but not exceeding eighteen inches, aerated, re-compacted, and retested to provide uniform compaction. Following satisfactory compaction of the subgrade, controlled compacted fill material should be placed to bring the site to the required grade.

Fill should not be placed over frozen soil. Soil subgrades should be protected against frost both during and after construction.

Proper drainage of construction areas should be provided to protect the subgrades from the detrimental effects of weather conditions. Excavations should be made with as few passes of the backhoe bucket as possible to reduce disturbance of the subgrade. A backhoe bucket fitted with a smooth blade should be used during the final subgrade preparation, where necessary. The exposed base should be kept free of standing water at all times. The site should be graded to carry any surface runoff away from the work areas. Construction traffic should be controlled to prevent excessive stresses and disturbance to the subgrade.

If pavements are not constructed immediately after grading, the subgrade should be shaped so as to prevent ponding. If there is a substantial lapse in time between grading and paving, or if the subgrade is disturbed, it should be proof-rolled with a loaded, tandem-wheeled dump truck. Soft spots observed during proof-rolling or initial construction should be removed and replaced with compacted granular fill.

Within the proposed paved areas, and extending a distance of five feet beyond the edge on all sides, excavate existing granular fill soils to a depth of two feet below existing site grades. It may be possible to reuse the existing granular fill, depending on the suitability of the material, as described herein.

Fill Placement and Compaction

Fill materials most likely will be obtained by importing granular fill materials from off-site borrow sources. However, it may be possible to reuse existing site granular fill material provided that it can be properly placed and compacted. The gradation shall be in accordance with MBTA Standard Specification Section 02200-Earthwork for Type B Gravel Borrow.

All structural fill should be free of organics, demolition debris or other deleterious substances. The fill material should have a plasticity index (PI) less than 4 and a liquid limit (LL) less than 10, and contain fragments less than 4 inches in maximum dimension. Each lift should be compacted to the specified density prior to placing any subsequent lift. All materials to be used as structural fill should be tested in the laboratory to determine their project suitability and compaction characteristics.

The fill should be systematically compacted to the following percentages of the maximum dry density:

Table 3: Fill Compaction Requirements

DESCRIPTION	MINIMUM PERCENT COMPACTION (ASTM D-1557)
General Site Fills, Structural Fill (Below Footings and Slabs)	95
Behind Retaining Walls	92
Landscape Area	90

Soils which exhibit a well-defined moisture content–dry density relationship should be compacted to within plus or minus two percentage points of the optimum moisture content as determined by the Modified Proctor test (ASTM D-1557).

Where fill materials are placed against an existing embankment slope, the slope should be benched as the fill is brought up in layers. Benching should be of a sufficient width to permit placing and compaction of fill material upon the existing embankment materials. Typically, benches are between four to eight feet wide. Each bench cut should begin at the intersection of the existing embankment and the vertical side of the previous bench. Trench backfills over pipelines or utility structures should be performed so as not to adversely impact the underlying utilities. In fill areas, the backfill material, compaction method, and degree of compaction requirements should be similar to that for the fill adjacent to the trench.

Construction Dewatering

All excavations should be performed in the dry condition. Discharge of pumped water should be performed in accordance with all federal, state and/or local regulations which may require a discharge permit and possible filtration and chemical testing of the water prior to discharge.

Permanent Slopes

Permanent slopes with loamed and seeded surfaces should not be steeper than 2-1/2 horizontal to 1 vertical (2-1/2H:1V) without slope protection to limit erosion and surficial sloughing of the slope. Additional analyses may be required to assess the stability of slopes steeper than 2-1/2H:1V as the station design is finalized.

Excavation Slopes and Shoring

The slopes of temporary open cuts should be no steeper than 1-1/2H:1V. Open cuts should not be used below the water table because of the likelihood of soil sloughing into the excavation.

The temporary excavation support system, if needed, should be selected by the Contractor and designed by an experienced Professional Engineer registered in the Commonwealth of Massachusetts and retained by the Contractor. Where excavation sides can be sloped back, they should be performed in accordance with the Occupational Safety and Health Administration (OSHA) Construction Industry Standards.

Protection of Existing Facilities

It is recommended that a geotechnical instrumentation and monitoring program be performed during construction of the project to evaluate impacts on adjacent structures. It is recommended that the program be developed to provide data for the following considerations:

- To monitor ground movements and vibration levels during construction.
- To provide early warning of potentially adverse trends by presenting sufficient data to determine the source of unanticipated ground movements, if present.
- If necessary, to plan remedial measures to limit damage to embankments and structures and to provide early warning when alternative means of protection are necessary.
- To document impacts of construction on adjacent facilities.
- To evaluate the performance and structural integrity of the constructed facilities.

We recommend the following instrumentation program to measure:

- Ground surface settlement and lateral movement adjacent to proposed construction.
- Horizontal and vertical movement of any excavation support system, and existing structures.
- Vibrations as a result of construction activities.

Vertical and horizontal survey points should be established on the adjacent structures. The monitoring points should be surveyed prior to the start of construction and monitored during construction to detect movement.

Vibration monitoring shall be conducted within 100 feet of existing structures during construction activities.

We recommend conducting a pre-construction survey of structures and utilities within 100 feet of the site to document existing conditions prior to construction. Documentation should include photographs, video, sketches, and/or written comments.

Specific instrumentation and monitoring requirements shall be based on the proposed construction sequence, duration of construction, and performance criteria. Initial measurements should be established well in advance of construction so that baseline data can be developed. This information will be invaluable for providing early warning of adverse trends and for assessing the need for mitigating measures.

CLOSING

This report and the recommendations contained herein have been prepared for the exclusive use of MBTA and VHB and their representatives for specific application to the design and construction of the proposed Freetown Station in Freetown, Massachusetts.

This report was prepared in accordance with generally accepted soil and foundation engineering practices. No warranty, expressed or implied, is made. The analysis, design and recommendations submitted in this report are based in part upon the data obtained from subsurface explorations available at the time of this report. Subsurface stratification variations between borings are anticipated. The reported groundwater levels only represent the water levels at the time noted on the logs. The nature and extent of variations between these explorations may not become evident until construction. If significant variations then appear, or if there are changes in the nature, design or location of the proposed structure, it may be necessary to reevaluate the recommendations of this report.

NOTES:

1. BORING LOCATIONS WERE DETERMINED BY INSTRUMENT SURVEY CONDUCTED BY COLER AND COLANTONIO, INC. IF OBSTRUCTIONS WERE ENCOUNTERED THE MOVED BORING LOCATIONS WERE APPROXIMATELY DETERMINED BY TAPE MEASUREMENT AND LINE OF SIGHT FROM EXISTING FEATURES AND SHOULD BE CONSIDERED ACCURATE TO THE DEGREE IMPLIED BY THE METHOD USED.
2. FOR BORING LOGS SEE GEOTECHNICAL REPORT DATED JANUARY 2012 APPENDIX A.
3. SURFACE DETAIL AND TOPOGRAPHY SHOWN HEREON IS FROM AN ON-THE-GROUND SURVEY PERFORMED BY COLER & COLANTONIO, INC., FROM APRIL 2010 TO SEPTEMBER 2010.
4. PRIMARY GEODETIC SURVEY CONTROL WAS ESTABLISHED FROM AN ON-THE-GROUND SURVEY BY COLER & COLANTONIO, INC. USING GLOBAL POSITIONING SYSTEM (GPS) SURVEY METHODS IN FEBRUARY 2010. THE GRID COORDINATES ARE BASED ON THE MASSACHUSETTS STATE PLANE COORDINATE SYSTEM (MAINLAND 2001 – NAD83).
5. CONTOURS AND ELEVATIONS SHOWN HEREON ARE BASED ON THE NATIONAL GEODETIC VERTICAL DATUM 1929 (NGVD29).

APPENDIX C: GEOTECHNICAL CALCULATIONS

- Allowable Bearing Capacity and Estimated Settlement
- Seismic Site Class Evaluation

343 Congress Street
Boston, MA 02210
617/242-9222

JOB	MBTA South Coast Rail		
SUBJECT	Freetown Station		
CALCULATED BY	DH	**DATE**	1/31/2012
CHECKED BY	PM	**DATE**	1/31/2012

PURPOSE: Evaluate bearing resistance for platform shallow foundations.

REFERENCE: AASHTO LRFD Bridge Design Specifications, 2010
AREMA Manual for Railway Engineering, 2011 Edition

ASSUMPTIONS:
- Platform footing is 4 ft wide by 10 ft long.
- Bearing surface is compacted Gravel Borrow overlying silt with sand (ML), silty sand and sand.
- Footing embedment is at least 4 feet below ground surface.
- Groundwater level is about 10 feet below bottom of foundation.
- Footing eccentricity is assumed to be zero.
- Estimated soil properties (experience, geotech literature, Table 10.4.6.2.4-1):

	γ (pcf)	ϕ
Gravel Borrow:	125	34

BEARING CAPACITY FACTORS (Table 10.6.3.1.2a-1):

	ϕ	N_c	N_q	N_γ
Gravel Borrow:	34	42.2	29.4	41.1

CALCULATE EFFECTIVE FOOTING WIDTH (B'):

$e < B/4$ (Section 10.6.3.3)

where: B = footing width (ft) = 4
e = eccentricity (ft)

Assume no footing eccentricity, thus, e = 0

B' = B-2e 4

NOMINAL BEARING RESISTANCE (q_n):

$q_n = cN_{cm} + \gamma D_f N_{qm} C_{wq} + 0.5\gamma B' N_{\gamma m} C_{w\gamma}$ (Eqn. 10.6.3.1.2a-1)

where:
c = cohesion = 0
γ = total unit weight = 125
D_f = depth of footing (ft) = 4 Assumed
B' = effective width of footing (ft) = 4
L = length of footing (ft) = 10
B'/L = 0.40
D_f /B' = 1.00
C_{wq} $C_{w\gamma}$ = groundwater correction factors (using B')
C_{wq} = 1.0 (Table 10.6.3.1.2a-2)
$C_{w\gamma}$ = 1.0 (Table 10.6.3.1.2a-2)

N_{cm} N_{qm} $N_{\gamma m}$ = bearing capacity factors

$N_{qm} = N_q s_q d_q i_q$ (Eqn. 10.6.3.1.2a-3)

s_q = 1.27 (Table 10.6.3.1.2a-3)

d_q = 1.20 (Table 10.6.3.1.2a-4)

i_q = 1.0 (see AASHTO p. 10-62)

N_{qm} = 44.8

343 Congress Street
Boston, MA 02210
617/242-9222

JOB	MBTA South Coast Rail		
SUBJECT	Freetown Station		
CALCULATED BY	DH	DATE	1/31/2012
CHECKED BY	PM	DATE	1/31/2012

$N_{\gamma m} = N_\gamma s_\gamma i_\gamma$

s_γ = 0.84 (Table 10.6.3.1.2a-3)

i_γ = 1 (see AASHTO p. 10-62)

$N_{\gamma m}$ = 34.5

q_n = 31,030 psf

ALLOWABLE BEARING RESISTANCE (q_a):

$q_a = q_n/FOS$

where: FOS = factor of safety = 2.5 for granular soil

q_a = 12,412 psf

use

q_a =	**12.41**	**ksf**

strength limit value

Note: Based on the anticipated light loads and potentially small footing sizes, an allowable bearing capacity of 6 ksf is recommended.

Elastic Settlement Calculations:

$$S_e = \frac{(q_o\,(1-\nu^2)\sqrt{A'})}{144 E_s \beta_z}$$

eqn. 10.6.2.4.2-1

where: q_o = applied vert. stress (ksf)
ν = Poisson's Ratio
E_s = Young's Modulus (ksi)
β_z = Shape/Rigidity Factor

ν = Poisson's Ratio =	0.30	(Table C10.4.6.3-1)
E_s = Young's Modulus (ksi) =	6.00	(Table C10.4.6.3-1)
β_z = Shape/Rigidity Factor =	1.11	(Table 10.6.2.4.2-1)

where:

B' = eff. width of footing (ft) =	4	(from bearing resistance calcs)
L = length of footing (ft):	10	(from bearing resistance calcs)
A' =(B'xL) = footing area (ft^2):	40	ft^2

Settlement (S_e) for a given q_o:

q_o = applied vertical stress (ksf) = 6.00 ksf (assumed)

Se (inches) = 0.43 inches

F_A = 1.6 (See Table 9.4.1.2.4a*)
F_V = 2.4 (See Table 9.4.1.2.4b*)

Design Spectral Response Parameters

$S_{MS} = Ss \times F_A$ = 0.368
$S_{M1} = S_1 \times F_V$ = 0.144

$S_{DS} = 2/3 \times S_{MS}$ = 0.245
$S_{D1} = 2/3 \times S_{M1}$ = 0.096

Notes: * The Massachusetts State Building Code, 8th Edition (2010)

9.4.1.2.1 Site Class Definitions. The site shall be classified as one of the following classes:

A = Hard rock with measured shear wave velocity, $\overline{v}_s$ > 5000ft/s (1500 m/s)

B = Rock with 2500 ft/s < $\overline{v}_s$ ≤5000 ft/s (760 m/s < $\overline{v}_s$ ≤ 1500 m/s)

C = Very dense soil and soft rock with 1200 ft/s ≤ $\overline{v}_s$ ≤ 2500 ft/s (370 m/s ≤ $\overline{v}_s$ ≤ 760 m/s) or $\overline{N}$ or $\overline{N}_{ch}$ > 50 or $\overline{s}_u$ ≥ 2000 psf (100 kPa)

D = Stiff soil with 600 ft/s ≤ $\overline{v}_s$ ≤ 1200 ft/s (180 m/s ≤ $\overline{v}_s$ ≤ 370 m/s) or with 15 ≤ $\overline{N}$ or $\overline{N}_{ch}$ ≤ 50 or 1000 psf ≤ $\overline{s}_u$ ≤ 2000 psf (50 kPa ≤ $\overline{s}_u$ ≤ 100 kPa)

E = A soil profile with $\overline{v}_s$ < 600 ft/s (180 m/s) or any profile with more than 10 ft (3 m) of soft clay. Soft clay is defined as soil with *PI* > 20, *w* ≥ 40%, and s_u < 500 psf (25 kPa)

F = Soils requiring site-specific evaluations:

1. Soils vulnerable to potential failure or collapse under seismic loading such as liquefiable soils, quick and highly sensitive clays, collapsible weakly cemented soils. Potential for liquefaction shall be evaluated in accordance with 780 CMR 1804.6: *Liquefaction*.

Exception. None.

2. Peats and/or highly organic clays (*H* > 10 ft [3 m] of peat and/or highly organic clay where *H* = thickness of soil).
3. Very high plasticity clays (H > 25 ft [7.6 m] with *PI* > 75).
4. Very thick soft/medium stiff clays (H>120 ft [37 m].

Exception. None.

TABLE 9.4.1.2.4a VALUES OF F_a AS A FUNCTION OF SITE CLASS AND SHORT PERIOD MAXIMUM CONSIDERED EARTHQUAKE SPECTRAL ACCELERATION

Site Class	Tabulated Maximum Considered Earthquake Spectral Response Acceleration at Short Periods					
	$S_S \le 0.26$	$0.27 \le S_S \le 0.29$	$0.30 \le S_S \le 0.32$	$0.33 \le S_S \le 0.35$	$0.36 \le S_S \le 0.38$	$S_S \ge 0.39$
A	0.8	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0	1.0

Checklist for Stormwater Report

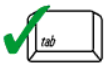
A. Introduction

Important: When filling out forms on the computer, use only the tab key to move your cursor - do not use the return key.



A Stormwater Report must be submitted with the Notice of Intent permit application to document compliance with the Stormwater Management Standards. The following checklist is NOT a substitute for the Stormwater Report (which should provide more substantive and detailed information) but is offered here as a tool to help the applicant organize their Stormwater Management documentation for their Report and for the reviewer to assess this information in a consistent format. As noted in the Checklist, the Stormwater Report must contain the engineering computations and supporting information set forth in Volume 3 of the Massachusetts Stormwater Handbook. The Stormwater Report must be prepared and certified by a Registered Professional Engineer (RPE) licensed in the Commonwealth.

The Stormwater Report must include:

- The Stormwater Checklist completed and stamped by a Registered Professional Engineer (see page 2) that certifies that the Stormwater Report contains all required submittals.[1] This Checklist is to be used as the cover for the completed Stormwater Report.
- Applicant/Project Name
- Project Address
- Name of Firm and Registered Professional Engineer that prepared the Report
- Long-Term Pollution Prevention Plan required by Standards 4-6
- Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan required by Standard 8[2]
- Operation and Maintenance Plan required by Standard 9

In addition to all plans and supporting information, the Stormwater Report must include a brief narrative describing stormwater management practices, including environmentally sensitive site design and LID techniques, along with a diagram depicting runoff through the proposed BMP treatment train. Plans are required to show existing and proposed conditions, identify all wetland resource areas, NRCS soil types, critical areas, Land Uses with Higher Potential Pollutant Loads (LUHPPL), and any areas on the site where infiltration rate is greater than 2.4 inches per hour. The Plans shall identify the drainage areas for both existing and proposed conditions at a scale that enables verification of supporting calculations.

As noted in the Checklist, the Stormwater Management Report shall document compliance with each of the Stormwater Management Standards as provided in the Massachusetts Stormwater Handbook. The soils evaluation and calculations shall be done using the methodologies set forth in Volume 3 of the Massachusetts Stormwater Handbook.

To ensure that the Stormwater Report is complete, applicants are required to fill in the Stormwater Report Checklist by checking the box to indicate that the specified information has been included in the Stormwater Report. If any of the information specified in the checklist has not been submitted, the applicant must provide an explanation. The completed Stormwater Report Checklist and Certification must be submitted with the Stormwater Report.

[1] The Stormwater Report may also include the Illicit Discharge Compliance Statement required by Standard 10. If not included in the Stormwater Report, the Illicit Discharge Compliance Statement must be submitted prior to the discharge of stormwater runoff to the post-construction best management practices.

[2] For some complex projects, it may not be possible to include the Construction Period Erosion and Sedimentation Control Plan in the Stormwater Report. In that event, the issuing authority has the discretion to issue an Order of Conditions that approves the project and includes a condition requiring the proponent to submit the Construction Period Erosion and Sedimentation Control Plan before commencing any land disturbance activity on the site.

Massachusetts Department of Environmental Protection
Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

B. Stormwater Checklist and Certification

The following checklist is intended to serve as a guide for applicants as to the elements that ordinarily need to be addressed in a complete Stormwater Report. The checklist is also intended to provide conservation commissions and other reviewing authorities with a summary of the components necessary for a comprehensive Stormwater Report that addresses the ten Stormwater Standards.

Note: Because stormwater requirements vary from project to project, it is possible that a complete Stormwater Report may not include information on some of the subjects specified in the Checklist. If it is determined that a specific item does not apply to the project under review, please note that the item is not applicable (N.A.) and provide the reasons for that determination.

A complete checklist must include the Certification set forth below signed by the Registered Professional Engineer who prepared the Stormwater Report.

Registered Professional Engineer's Certification

I have reviewed the Stormwater Report, including the soil evaluation, computations, Long-term Pollution Prevention Plan, the Construction Period Erosion and Sedimentation Control Plan (if included), the Long-term Post-Construction Operation and Maintenance Plan, the Illicit Discharge Compliance Statement (if included) and the plans showing the stormwater management system, and have determined that they have been prepared in accordance with the requirements of the Stormwater Management Standards as further elaborated by the Massachusetts Stormwater Handbook. I have also determined that the information presented in the Stormwater Checklist is accurate and that the information presented in the Stormwater Report accurately reflects conditions at the site as of the date of this permit application.

Registered Professional Engineer Block and Signature

Signature and Date

Checklist

Project Type: Is the application for new development, redevelopment, or a mix of new and redevelopment?

☐ New development

☐ Redevelopment

☒ Mix of New Development and Redevelopment

Checklist for Stormwater Report

Checklist (continued)

LID Measures: Stormwater Standards require LID measures to be considered. Document what environmentally sensitive design and LID Techniques were considered during the planning and design of the project:

- ☒ No disturbance to any Wetland Resource Areas
- ☐ Site Design Practices (e.g. clustered development, reduced frontage setbacks)
- ☒ Reduced Impervious Area (Redevelopment Only)
- ☒ Minimizing disturbance to existing trees and shrubs
- ☐ LID Site Design Credit Requested:
  - ☐ Credit 1
  - ☐ Credit 2
  - ☐ Credit 3
- ☒ Use of "country drainage" versus curb and gutter conveyance and pipe
- ☒ Bioretention Cells (includes Rain Gardens)
- ☐ Constructed Stormwater Wetlands (includes Gravel Wetlands designs)
- ☐ Treebox Filter
- ☐ Water Quality Swale
- ☒ Grass Channel
- ☐ Green Roof
- ☐ Other (describe): _____

Standard 1: No New Untreated Discharges

- ☒ No new untreated discharges
- ☐ Outlets have been designed so there is no erosion or scour to wetlands and waters of the Commonwealth
- ☐ Supporting calculations specified in Volume 3 of the Massachusetts Stormwater Handbook included.

Checklist for Stormwater Report

Checklist (continued)

Standard 2: Peak Rate Attenuation

☐ Standard 2 waiver requested because the project is located in land subject to coastal storm flowage and stormwater discharge is to a wetland subject to coastal flooding.

☐ Evaluation provided to determine whether off-site flooding increases during the 100-year 24-hour storm.

☒ Calculations provided to show that post-development peak discharge rates do not exceed pre-development rates for the 2-year and 10-year 24-hour storms. If evaluation shows that off-site flooding increases during the 100-year 24-hour storm, calculations are also provided to show that post-development peak discharge rates do not exceed pre-development rates for the 100-year 24-hour storm.

Standard 3: Recharge

☐ Soil Analysis provided.

☒ Required Recharge Volume calculation provided.

☐ Required Recharge volume reduced through use of the LID site Design Credits.

☐ Sizing the infiltration, BMPs is based on the following method: Check the method used.

☒ Static ☐ Simple Dynamic ☐ Dynamic Field[1]

☒ Runoff from all impervious areas at the site discharging to the infiltration BMP.

☐ Runoff from all impervious areas at the site is *not* discharging to the infiltration BMP and calculations are provided showing that the drainage area contributing runoff to the infiltration BMPs is sufficient to generate the required recharge volume.

☒ Recharge BMPs have been sized to infiltrate the Required Recharge Volume.

☐ Recharge BMPs have been sized to infiltrate the Required Recharge Volume *only* to the maximum extent practicable for the following reason:

- ☐ Site is comprised solely of C and D soils and/or bedrock at the land surface
- ☐ M.G.L. c. 21E sites pursuant to 310 CMR 40.0000
- ☐ Solid Waste Landfill pursuant to 310 CMR 19.000
- ☐ Project is otherwise subject to Stormwater Management Standards only to the maximum extent practicable.

☒ Calculations showing that the infiltration BMPs will drain in 72 hours are provided.

☐ Property includes a M.G.L. c. 21E site or a solid waste landfill and a mounding analysis is included.

[1] 80% TSS removal is required prior to discharge to infiltration BMP if Dynamic Field method is used.

Checklist for Stormwater Report

Checklist (continued)

Standard 3: Recharge (continued)

☐ The infiltration BMP is used to attenuate peak flows during storms greater than or equal to the 10-year 24-hour storm and separation to seasonal high groundwater is less than 4 feet and a mounding analysis is provided.

☐ Documentation is provided showing that infiltration BMPs do not adversely impact nearby wetland resource areas.

Standard 4: Water Quality

The Long-Term Pollution Prevention Plan typically includes the following:

- Good housekeeping practices;
- Provisions for storing materials and waste products inside or under cover;
- Vehicle washing controls;
- Requirements for routine inspections and maintenance of stormwater BMPs;
- Spill prevention and response plans;
- Provisions for maintenance of lawns, gardens, and other landscaped areas;
- Requirements for storage and use of fertilizers, herbicides, and pesticides;
- Pet waste management provisions;
- Provisions for operation and management of septic systems;
- Provisions for solid waste management;
- Snow disposal and plowing plans relative to Wetland Resource Areas;
- Winter Road Salt and/or Sand Use and Storage restrictions;
- Street sweeping schedules;
- Provisions for prevention of illicit discharges to the stormwater management system;
- Documentation that Stormwater BMPs are designed to provide for shutdown and containment in the event of a spill or discharges to or near critical areas or from LUHPPL;
- Training for staff or personnel involved with implementing Long-Term Pollution Prevention Plan;
- List of Emergency contacts for implementing Long-Term Pollution Prevention Plan.

☒ A Long-Term Pollution Prevention Plan is attached to Stormwater Report and is included as an attachment to the Wetlands Notice of Intent.

☐ Treatment BMPs subject to the 44% TSS removal pretreatment requirement and the one inch rule for calculating the water quality volume are included, and discharge:

- ☐ is within the Zone II or Interim Wellhead Protection Area
- ☐ is near or to other critical areas
- ☐ is within soils with a rapid infiltration rate (greater than 2.4 inches per hour)
- ☐ involves runoff from land uses with higher potential pollutant loads.

☐ The Required Water Quality Volume is reduced through use of the LID site Design Credits.

☒ Calculations documenting that the treatment train meets the 80% TSS removal requirement and, if applicable, the 44% TSS removal pretreatment requirement, are provided.

Checklist for Stormwater Report

Checklist (continued)

Standard 4: Water Quality (continued)

☒ The BMP is sized (and calculations provided) based on:

- ☒ The ½" or 1" Water Quality Volume or
- ☐ The equivalent flow rate associated with the Water Quality Volume and documentation is provided showing that the BMP treats the required water quality volume.

☐ The applicant proposes to use proprietary BMPs, and documentation supporting use of proprietary BMP and proposed TSS removal rate is provided. This documentation may be in the form of the propriety BMP checklist found in Volume 2, Chapter 4 of the Massachusetts Stormwater Handbook and submitting copies of the TARP Report, STEP Report, and/or other third party studies verifying performance of the proprietary BMPs.

☐ A TMDL exists that indicates a need to reduce pollutants other than TSS and documentation showing that the BMPs selected are consistent with the TMDL is provided.

Standard 5: Land Uses With Higher Potential Pollutant Loads (LUHPPLs)

☐ The NPDES Multi-Sector General Permit covers the land use and the Stormwater Pollution Prevention Plan (SWPPP) has been included with the Stormwater Report.

☒ The NPDES Multi-Sector General Permit covers the land use and the SWPPP will be submitted ***prior to*** the discharge of stormwater to the post-construction stormwater BMPs.

☐ The NPDES Multi-Sector General Permit does ***not*** cover the land use.

☒ LUHPPLs are located at the site and industry specific source control and pollution prevention measures have been proposed to reduce or eliminate the exposure of LUHPPLs to rain, snow, snow melt and runoff, and been included in the long term Pollution Prevention Plan.

☐ All exposure has been eliminated.

☐ All exposure has ***not*** been eliminated and all BMPs selected are on MassDEP LUHPPL list.

☒ The LUHPPL has the potential to generate runoff with moderate to higher concentrations of oil and grease (e.g. all parking lots with >1000 vehicle trips per day) and the treatment train includes an oil grit separator, a filtering bioretention area, a sand filter or equivalent.

Standard 6: Critical Areas

☐ The discharge is near or to a critical area and the treatment train includes only BMPs that MassDEP has approved for stormwater discharges to or near that particular class of critical area.

☐ Critical areas and BMPs are identified in the Stormwater Report.

Checklist for Stormwater Report

Checklist (continued)

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the maximum extent practicable

☒ The project is subject to the Stormwater Management Standards only to the maximum Extent Practicable as a:

- ☐ Limited Project
- ☐ Small Residential Projects: 5-9 single family houses or 5-9 units in a multi-family development provided there is no discharge that may potentially affect a critical area.
- ☐ Small Residential Projects: 2-4 single family houses or 2-4 units in a multi-family development with a discharge to a critical area
- ☐ Marina and/or boatyard provided the hull painting, service and maintenance areas are protected from exposure to rain, snow, snow melt and runoff
- ☐ Bike Path and/or Foot Path
- ☐ Redevelopment Project
- ☒ Redevelopment portion of mix of new and redevelopment.

☐ Certain standards are not fully met (Standard No. 1, 8, 9, and 10 must always be fully met) and an explanation of why these standards are not met is contained in the Stormwater Report.

☐ The project involves redevelopment and a description of all measures that have been taken to improve existing conditions is provided in the Stormwater Report. The redevelopment checklist found in Volume 2 Chapter 3 of the Massachusetts Stormwater Handbook may be used to document that the proposed stormwater management system (a) complies with Standards 2, 3 and the pretreatment and structural BMP requirements of Standards 4-6 to the maximum extent practicable and (b) improves existing conditions.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control

A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan must include the following information:

- Narrative;
- Construction Period Operation and Maintenance Plan;
- Names of Persons or Entity Responsible for Plan Compliance;
- Construction Period Pollution Prevention Measures;
- Erosion and Sedimentation Control Plan Drawings;
- Detail drawings and specifications for erosion control BMPs, including sizing calculations;
- Vegetation Planning;
- Site Development Plan;
- Construction Sequencing Plan;
- Sequencing of Erosion and Sedimentation Controls;
- Operation and Maintenance of Erosion and Sedimentation Controls;
- Inspection Schedule;
- Maintenance Schedule;
- Inspection and Maintenance Log Form.

☒ A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan containing the information set forth above has been included in the Stormwater Report.

Checklist for Stormwater Report

Checklist (continued)

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control (continued)

☐ The project is highly complex and information is included in the Stormwater Report that explains why it is not possible to submit the Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan with the application. A Construction Period Pollution Prevention and Erosion and Sedimentation Control has ***not*** been included in the Stormwater Report but will be submitted ***before*** land disturbance begins.

☐ The project is ***not*** covered by a NPDES Construction General Permit.

☐ The project is covered by a NPDES Construction General Permit and a copy of the SWPPP is in the Stormwater Report.

☒ The project is covered by a NPDES Construction General Permit but no SWPPP been submitted. The SWPPP will be submitted BEFORE land disturbance begins.

Standard 9: Operation and Maintenance Plan

☒ The Post Construction Operation and Maintenance Plan is included in the Stormwater Report and includes the following information:

- ☒ Name of the stormwater management system owners;
- ☒ Party responsible for operation and maintenance;
- ☒ Schedule for implementation of routine and non-routine maintenance tasks;
- ☒ Plan showing the location of all stormwater BMPs maintenance access areas;
- ☐ Description and delineation of public safety features;
- ☐ Estimated operation and maintenance budget; and
- ☐ Operation and Maintenance Log Form.

☐ The responsible party is ***not*** the owner of the parcel where the BMP is located and the Stormwater Report includes the following submissions:

- ☐ A copy of the legal instrument (deed, homeowner's association, utility trust or other legal entity) that establishes the terms of and legal responsibility for the operation and maintenance of the project site stormwater BMPs;
- ☐ A plan and easement deed that allows site access for the legal entity to operate and maintain BMP functions.

Standard 10: Prohibition of Illicit Discharges

☒ The Long-Term Pollution Prevention Plan includes measures to prevent illicit discharges;

☐ An Illicit Discharge Compliance Statement is attached;

☐ NO Illicit Discharge Compliance Statement is attached but will be submitted ***prior to*** the discharge of any stormwater to post-construction BMPs.

1

Stormwater Report Narrative

This Stormwater Report has been prepared to demonstrate compliance with the Massachusetts Stormwater Management Standards in accordance with the Massachusetts Wetlands Protection Act Regulations (310 CMR 10.00) and Water Quality Certification Regulations (314 CMR 9.00).

1.1 Project Description

The Applicant, MassDOT, is proposing to construct a commuter rail overnight layover facility at the Weaver's Cove East site, located adjacent to 2804 North Main Street in Fall River, Massachusetts along the Fall River Secondary Line (the Project). The Project will include six layover tracks, a paved driveway and access aisle around the layover tracks, ancillary landscape improvements, 41 parking spaces, two operation and maintenance buildings, and utility improvements to support this use. The Project involves demolishing concrete pads and multiple bituminous driveways that currently exist on the site.

The site will be considered a Land Use with Higher Potential Pollutant Loads (LUHPPL) as defined in 3.10 CMR 10.04 and 314 CMR 9.02 because the use is regulated under the NPDES Multi-Sector General Permit.

1.2 Site Description

The Project site consists of approximately 18 acres of land (the Site) located adjacent to 2804 North Main Street in Fall River, Massachusetts (Figures 1 and 2). The Site is northeast of Weaver's Cove Energy, LCC located at 1 New Street in Fall River, adjacent to residential buildings to the north, south and east and the MBTA railroad right-of-way to the west.

There are no Wetland Resource Areas located on the Site.

According to the National Resources Conservation Service (NRCS), surface soils on the Site include Paxton Fine Sandy Loam, smoothed Udorthents, and Urban land classified as Hydrologic Soil Groups (HSG) C, B and D respectively.

The Site is not located within the 100-year flood plain as shown on the FEMA Floodway Map, City of Fall River, Massachusetts Bristol County, Community Panel Number 25005C0332F dated July 7, 2009. The 100-year flood elevation is lower than the finished grade elevation of the layover yard. The FEMA map is included in Appendix B. This site is also located within the Massachusetts Coastal Zone.

1.3 Existing Drainage Conditions

The Site is currently almost entirely undeveloped land with a small portion that was previously developed at the southern end. For the existing conditions hydrologic analysis, the Site was divided into seven drainage areas that contribute to four separate design points. The following paragraphs summarize each drainage area.

Drainage Area 1

This 3.21-acre area in the southwest portion of the Site consists of predominantly impervious concrete pads with a small portion of grassy pasture urban land. This grassy area sheet flows to a catch basin to the north of the concrete pads where it is captured by the closed drainage system that drains to the Taunton River.

Drainage Area 2

This 3.83-acre area in the southern portion of the Site, north of Drainage Area 1, consists of mainly open space with a small portion of impervious area that sheet flows to a vegetated depression in the center of Drainage Area 2 where it infiltrates or overflows to Drainage Area 3 in larger storm events.

Drainage Area 3

This 7.14-acre area in the center of the Site consists predominantly of open space areas with small patches of paved area that sheet flows to a catch basin in the center of the Site. The catch basin is part of a closed drainage system that drains to the Taunton River.

Drainage Area 4

This 1.34-acre area in the northern portion of the Site consists predominantly of open space with small patches of paved area that sheet flows to a vegetated depression adjacent to North Main Street where it infiltrates.

Drainage Area 5

This 1.62-acre area in the northern portion of the Site consists of open space with multiple concrete pads and some paved area that sheet flows to a vegetated depression south of the property at 2990 North Main Street where it infiltrates.

Drainage Area 6

This 0.43-acre area in the southwest portion of the Site consists of partially open space and partially paved area that sheet flows to a culvert underneath the railroad ROW, ultimately discharging to the Taunton River.

Drainage Area 7

This 0.63-acre area in the northwest portion of the Site consists of open space that sheet flows towards a ditch along the railroad ROW, ultimately discharging to the Taunton River.

Figure 3 illustrates the existing drainage patterns on the Site. Table 1 provides a summary of the existing conditions hydrologic data.

Table 1 Existing Conditions Hydrologic Data

Drainage Area	Discharge Location	Design Point	Area (acres)	Curve Number	Time of Concentration (min)
1	Taunton River	1	3.21	98	5.0
2	Taunton River	1	3.83	72	7.8
3	Taunton River	1	7.14	71	19.4
4	Depression 2	3	1.34	73	7.7

1.4 Proposed Drainage Conditions

Figure 4 illustrates the proposed "post-construction" drainage conditions for the Project. As shown, the Site would be divided into nine drainage areas that discharge treated stormwater to three existing Design Points and one new design point. Existing drainage and grading patterns were maintained to the maximum extent possible in proposed conditions. Low impact development stormwater management techniques have been incorporated into the design. These practices are focused on decentralizing stormwater management techniques into the design that will reduce peak runoff rates, maximize groundwater recharge and treat for water quality. The following is a summary of each drainage area in the post-construction condition.

Drainage Area 1

This 3.68-acre area in the southwest portion of the Site consists of primarily open space with small patches of gravel. In the proposed condition the stormwater would be directed from the east and west to a grass channel that enters a culvert underneath the paved access driveway and outlets to a sediment forebay before entering an infiltration basin. An outlet control structure manages the water level in the basin and directs stormwater to the existing closed drainage system that discharges to the Taunton River.

Drainage Area 2

This 1.67-acre area in the eastern portion of the Site consists of predominantly landscaped area. In the proposed condition the stormwater would sheet flow to a depression on the eastern side of the proposed parking area. Runoff from the driveway sheet flows through a gravel and grass filter strip for pretreatment then into the depression. This depression is designed to infiltrate all stormwater from Drainage Area 2 that is collected during a 100-year storm.

Drainage Area 3

This 0.77-acre area in the southern portion of the Site consists of paved parking areas for the operation and maintenance buildings and landscaped islands. The paved parking areas would be pitched to the west to allow the stormwater to drain into the grass channel in Drainage Area 1 and discharge into a sediment forebay for treatment and then into an infiltration basin. An outlet control structure manages the water level in the basin and directs stormwater to the existing closed drainage system that discharges to the Taunton River.

Drainage Area 4

This 3.60-acre area in the eastern portion of the Site consists of existing landscaped areas and that would be slightly re-graded to allow for the installation of two sediment forebays and an infiltration basin. Runoff from the grass area would sheet flow to the infiltration basin. Stormwater from the driveway would sheet flow through a gravel and grass filter strip for pretreatment then into the infiltration basin. An outlet control structure manages the water level in the basin and directs stormwater to the existing closed drainage system that discharges to the Taunton River. The Best Management Practices (BMPs) in Drainage Area 4 manage the runoff from Drainage Areas 1, 3, 4 and 5.

Drainage Area 5

This 4.83-acre area in the western portion of the Site consists of a paved driveway for access to the site, layover tracks, and access aisles around the layover tracks. In the proposed condition, stormwater from the layover tracks would drain to underdrains that would be fed into an oil grit separator and then outlet into a sediment forebay before entering an infiltration basin. An outlet control structure manages the water

level in the basin and directs stormwater to the existing closed drainage system that discharges to the Taunton River.

Drainage Area 6

This 0.73-acre area in the northeast portion of the Site consists of predominantly landscaped area maintained from the existing condition. Stormwater would sheet flow to a depression adjacent to the access aisle around the layover tracks. This depression is designed to infiltrate all stormwater from Drainage Area 6 that is collected during a 100-year storm.

Drainage Area 7

This 1.38-acre area in the northern portion of the Site consists of predominantly landscape areas with small patches of impervious concrete pads. In the proposed condition this drainage area would be regraded to incorporate a depression. This depression is designed to infiltrate all stormwater from Drainage Area 7 that is collected during a 100-year storm.

Drainage Area 8

This 0.61-acre area in the western portion of the Site consists of unpaved area for the track ladder entering the layover yard. Under existing conditions this drainage area sheet flows to a culvert underneath the railroad right-of-way. In the proposed condition this drainage area would sheet flow untreated to the same culvert underneath the railroad ROW.

Drainage Area 9

This 0.94-acre area in the western portion of the Site consists of all grass area which would sheet flow to the ditch adjacent to the railroad ROW and ultimately discharge to the Taunton River.

Table 2 provides a summary of the proposed conditions hydrologic data.

Table 2 Proposed Conditions Hydrologic Data

Drainage Area	Discharge Location	Design Point	Area (acres)	Curve Number	Time of Concentration (min)
1	Taunton River	1	3.68	84	20.9
2	Depression 1	2	1.67	78	5.0
3	Taunton River	1	0.77	93	5.0
4	Taunton River	1	3.60	72	12.1
5	Taunton River	1	4.83	98	5.0
6	Depression 2	3	0.73	83	5.0
7	Depression 3	4	1.38	77	5.0
8	Taunton River	1	0.61	92	5.0
9	Taunton River	1	0.94	69	5.0

The Site has been designed with a comprehensive stormwater management system that has been developed in accordance with the Massachusetts Stormwater Handbook. The proposed stormwater management system has been designed to treat the 1.0 inch Water Quality Volume.

1.5 Environmentally Sensitive and Low Impact Development (LID) Techniques

Low Impact Development (LID) techniques and stormwater Best Management Practices (BMPs) implemented into the Project design include:

- Grassed Channel
- Gravel and Grass Filter Strip
- Infiltration Basin
- Sediment Forebays

In general, stormwater runoff from all impervious surfaces in proposed conditions would receive some form of treatment for stormwater quality prior to discharge to the existing design points. Under existing conditions no such treatment is provided for stormwater runoff.

1.6 Hydraulic Analysis

The closed drainage system was designed for the 25-year storm event, in accordance with the Massachusetts Bay Transportation Authority *Railroad Operations, Commuter Rail Design Standards Manual*, Volume 1.

Drainage pipes were sized using Manning's Equation for full-flow capacity and the Rational Method. Pipe sizing calculations are included in Appendix A of this report.

Regulatory Compliance

This Chapter describes the Project's compliance with the Massachusetts Department of Environmental Protection (MassDEP) Stormwater Management Standards. The Project fully complies with the MassDEP Stormwater Management Standards at 310 CMR 10.05.

Standard 1: No New Untreated Discharges or Erosion to Wetlands

The Project has been designed to fully comply with Standard 1.

No drainage from the Site discharges to wetlands. All drainage from the Site either infiltrates or discharges to the Taunton River after being treated.

The BMPs included in the proposed stormwater management system have been designed in accordance with the Massachusetts Stormwater Handbook. Supporting information and computations demonstrating that no new untreated discharges would result from the Project are presented through compliance with Standards 4 through 6.

All proposed Project stormwater outlets and conveyances have been designed to not cause erosion or scour to wetlands or receiving waters. Outlets from closed drainage systems have been designed with flared end sections and stone protection to dissipate discharge velocities. Overflows from BMPs that impound stormwater have been designed with stone to protect down gradient areas from erosion.

Standard 2: Peak Rate Attenuation

The Project has been designed to fully comply with Standard 2.

The rainfall-runoff response of the Site under existing and proposed conditions was analyzed for storm events with recurrence intervals of 2, 10, and 100 years. The results of the analysis, as summarized in Table 3, indicate that there is no increase in peak discharge rates between the existing and proposed conditions. The peak discharge for Design Points 2, 3 and 4 is 0.0 cfs because all of the stormwater is

infiltrated through new depressions and will not be discharging to the same point as in the existing conditions.

Computations and supporting information regarding the hydrologic modeling are included in Appendix B.

Table 3 Peak Discharge Rates (cfs*)

Design Point	2-year	10-year	100-year
Design Point 1: Taunton River			
Existing	14.3	22.2	33.3
Proposed	2.7	4.6	14.7
Design Point 2: Depression 1			
Existing	-	-	-
Proposed	0.0	0.0	0.0
Design Point 3: Depression 2			
Existing	0.1	1.3	5.6
Proposed	0.0	0.0	0.0
Design Point 4: Depression 3			
Existing	0.0	0.06	1.2
Proposed	0.0	0.0	0.0

Standard 3: Stormwater Recharge

Since the Site is comprised of predominantly B soils, the Project has been designed to infiltrate the required recharge volume. The addition of pervious area in the proposed conditions from the removal of concrete pads on the south side of the Site would contribute to additional recharge to groundwater.

In accordance with the Stormwater Handbook, the Required Recharge Volume for the Project is 4,785 cubic feet. The Project proposes to exceed the standard of 4,785 cubic feet of recharge volume.

Recharge of stormwater has been provided through the use of four depressions. Each depression has been designed to provide the proper storage for recharge and the required square footage to ensure the depression drains completely within 72 hours.

Standard 4: Water Quality

The Project has been designed to fully comply with Standard 4.

The proposed stormwater management system implements a treatment train of BMPs that has been designed to provide 80 percent total suspended solids (TSS) removal of stormwater runoff from all proposed impervious surfaces.

Computations and supporting information, including the Long-Term Pollution Prevention Plan, are included in Appendix D.

Standard 5: Land Uses with Higher Potential Pollutant Loads (LUHPPLs)

The Project is considered a Land Use with Higher Potential Pollutant Loads (LUHPPL) as defined in 3.10 CMR 10.04 and 314 CMR 9.02. Due to the storage tracks, the layover facility would be classified as a LUHPPL and would require certain BMPs to prevent contamination of local wetlands and water resources such as the Taunton River. The storage tracks would have collection trays to catch any incidental drips, leaks, or spills of hazardous materials that may occur during storage or maintenance. The collection trays would be connected to an oil/water separator that would separate petroleum products from stormwater runoff prior to discharge, protecting the Taunton River and adjacent wetlands from contamination. Any oil or other hazardous materials stored at the Site would be secured with secondary containment structures to catch any spills. With the proposed containment measures in place, the layover facility would not pose a significant risk to the Taunton River or other surface or groundwater resources at this Site.

Standard 6: Critical Areas

The Project will not discharge stormwater near or to a critical area.

Standard 7: Redevelopments and Other Projects Subject to the Standards only to the Maximum Extent Practicable

The Project is a partial redevelopment, but has still been designed to fully comply with all ten of the Stormwater Management Standards.

Refer directly to each Standard for applicable computations and supporting information demonstrating compliance with each.

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Controls

The Project would disturb approximately 18.0 acres of land and is therefore required to obtain coverage under the US Environmental Protection Agency (EPA) National Pollutant Discharge Elimination System (NPDES) Construction General Permit (CGP). As required under this permit, a Stormwater Pollution Prevention Plan (SWPPP) would be developed and the Notice of Intent for the CGP would be submitted by the contractor and owner at least 14 days before land disturbance begins. Recommended construction period pollution prevention and erosion and sedimentation controls were discussed in the DEIS/DEIR. Appropriate controls will be prepared and implemented by the contractor and MassDOT (MBTA) during construction in accordance with the final design and NPDES SWPPP.

Standard 9: Operation and Maintenance Plan

In compliance with Standard 9, a Post Construction Stormwater Operation and Maintenance (O&M) Plan will be developed by the MBTA during the final design for the Project.

Standard 10: Prohibition of Illicit Discharges

Storm drainage structures remaining from the previous development that are part of the redevelopment area will be removed and replaced. The design plans submitted with this report have been developed so that the components included therein are in full compliance with current standards. No statement is made with regard to the drainage system in portions of the Site not included in the redevelopment project area. The Long-Term Pollution Prevention Plan will include measures to prevent illicit discharges.

Appendix B
Standard 2 Computations and Supporting Information

Rainfall volumes used for this analysis were based on the Natural Resources Conservation Service (NRCS) Type III, 24-hour storm event for Bristol County. Runoff coefficients for the existing and proposed conditions, as previously shown in Tables 1 and 2 respectively, were determined using NRCS Technical Release 55 (TR-55) methodology as provided in HydroCAD. The HydroCAD model is based on the NRCS Technical Release 20 (TR-20) Model for Project Formulation Hydrology.

MAP INFORMATION

Map Scale: 1:3,520 if printed on A size (8.5" × 11") sheet.

The soil surveys that comprise your AOI were mapped at 1:20,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for accurate map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: UTM Zone 19N NAD83

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Bristol County, Massachusetts, Southern Part
Survey Area Data: Version 6, Jul 23, 2010

Date(s) aerial images were photographed: 8/14/2003

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Hydrologic Soil Group— Summary by Map Unit — Bristol County, Massachusetts, Southern Part (MA603)				
Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
306D	Paxton fine sandy loam, 15 to 25 percent slopes, very stony	C	4.7	15.7%
602	Urban land		11.1	37.5%
651	Udorthents, smoothed	B	13.9	46.8%
Totals for Area of Interest			**29.7**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Stormwater Report Narrative

This Stormwater Report has been prepared to demonstrate compliance with the Massachusetts Stormwater Management Standards in accordance with the Massachusetts Wetlands Protection Act Regulations (310 CMR 10.00) and Water Quality Certification Regulations (314 CMR 9.00).

1.1 Project Description

MassDOT is proposing to construct an overnight commuter rail layover facility at a location known as Wamsutta, situated on a previously developed parcel adjacent to 216 Herman Melville Boulevard in New Bedford, Massachusetts along the New Bedford Main Line (the Project). The Project proposes six layover tracks, a paved driveway and access aisle around the layover tracks, ancillary landscape improvements, 39 parking spaces, one operation and maintenance building, one power substation, and one crew quarters building along with utility connections to support this use.

The Project is considered a Land Use with Higher Potential Pollutant Loads (LUHPPL) as defined in 3.10 CMR 10.04 and 314 CMR 9.02 because the use is regulated under the NPDES Multi-Sector General Permit.

1.2 Site Description

The Site is an approximately 11-acre parcel of land located at the end of the New Bedford Main Line in New Bedford, Massachusetts (Figure 1). It is located near the intersection of Wamsutta Street and Herman Melville Boulevard, near the southern terminus of the New Bedford Main Line, immediately north of the proposed Whale's Tooth Station. The Site is on the east side of the railroad right-of-way (ROW), opposite the proposed Whale's Tooth Station platform and adjacent to an existing freight rail yard. New Bedford Harbor lies to the east, just beyond the existing freight yard and Herman Melville Boulevard. The Site is ideally suited for a terminal

storage/ layover facility since it is located in an industrial area adjacent to a freight rail yard and is at the end of the railroad line, limiting deadhead moves.

The former Conrail Yard comprising the Site was managed as a voluntary "Brownfields" redevelopment site. Soils near the center of the Site contained elevated concentrations of polychlorinated biphenyls (PCB), arsenic, lead, and polycyclic aromatic hydrocarbons (PAHs) with the perimeter soils having lower concentrations of these contaminants. An agreement was reached with the Massachusetts Department of Environmental Protection (MassDEP) and US Environmental Protection Agency (EPA) based on the financial infeasibility of remediating contamination at the Site. The contamination was proposed to be left in place with proper engineering controls, such as a soil geotextile composition cap and land use restrictions consisting of an Activity and Use Limitation (AUL) in the areas exhibiting the highest concentrations of contamination above the Upper Concentration Limits. Since contaminated soil was left in place, there are potential human health impacts related to exposure during future soil disturbance at the Site during construction related to the South Coast Rail Project.

There is no Wetland Resource Area located on the Site, but the proposed layover facility is within the 100-foot buffer zone of a jurisdictional wetland just north of the Site, along Wamsutta Street. Hydrologic Soil Group (HSG) data is not available from National Resources Conservation Service (NRCS) for this site.

The project is not located within the 100-year flood plain as shown on the FEMA Floodway Map, City of New Bedford, Massachusetts Bristol County, Community Panel Number 25005C0393F dated July 7, 2009. This map is included in Appendix A. The proposed layover facility is located entirely within the coastal zone associated with New Bedford Inner Harbor but is not within the New Bedford/Fairhaven Designated Port Area (DPA).

1.3 Existing Drainage Conditions

The majority of the Site is currently situated on an engineered cap. The cap consists of a permeable geotextile material that is covered with a layer of soil and crushed stone, which varies in depth from 1 to 3 feet. Vegetation has grown in a swath along the easternmost freight yard track that was left without the crushed stone layer. When it rains, water seeps into the crushed stone layer and pools above the cap to a depth just a few inches below the top of the crushed stone. Some water flows through the crushed stone and to the vegetated area, where water also pools. In peak storm events, water flows off the Site, into the wetland/stream to the north of the Site and ultimately to the harbor.

1.4 Proposed Drainage Conditions

There has not been any ground survey taken of the Site, so the proposed drainage is conceptual. The Project is a redevelopment of the Site, so as stated in Standard 7 of the Massachusetts Stormwater Standards, it is subject to Standards 2, 3, 4, 5, and 6 to the maximum extent practicable. The Site is subject to coastal storm flowage as defined in 310 CMR 10.04, so it is not subject Standard 2. An overview of planned drainage is provided. Runoff would be split between three drainage areas.

The northern part of the Site, including the access roads and the body of the tracks, would drain into either one of two grass channels adjacent to the outermost tracks. On the east side of the Site, the grass channel would direct runoff towards the center of the facility to a concrete pipe that runs under the layover tracks to the west side. On the west side of the Site, the grass channel would direct runoff towards the center of the facility to a ballast inlet, tying the east and west sides together. From the ballast inlet, the stormwater flows through a concrete pipe under the main line to a water quality manhole. Finally, a concrete pipe connects the water quality manhole with the municipal drainage system in Acushnet Avenue.

The stormwater for the southern part of the Site would be captured by subdrains adjacent to the outermost tracks. Drip pans would be located in the track where locomotives will be tied-down overnight to collect higher potential pollution loads and channel any runoff into the closed drainage system. The subdrains and drip pans combine flows into a single water quality manhole located on the west side of the main line. From the water quality manhole, the stormwater flows through a concrete pipe south to tie into the municipal system near proposed Whales Tooth Station parking area.

The third drainage area includes the employee parking lot and support building footprints. There are limited options for managing the drainage due to the underlying cap. Pervious pavement will be used for the parking area to decrease runoff and provide maximum area for infiltration. Runoff from the roofs of the building will flow into a gutter and downspout system and will be collected in a rain barrel.

The Site has been designed with a comprehensive stormwater management system to the maximum extent practicable that has been developed in accordance with the Massachusetts Stormwater Standards.

1.5 Environmentally Sensitive and Low Impact Development (LID) Techniques

Low Impact Development (LID) techniques and stormwater Best Management Practices (BMPs) implemented into the site design include:

- Minimal disturbance to exiting trees and vegetation
- Grassed Channels
- Gravel and Grass Filter Strip
- Pervious Pavement

In general, stormwater runoff from all impervious surfaces in proposed conditions would receive some form of treatment for stormwater quality prior to discharge to the existing design points. Under existing conditions no such treatment is provided for stormwater runoff.

Appendix 5.2-A

Economic Development Research Group, Inc. Net Change in Households in the South Coast Due to Development & Operation of the South Coast Rail

Proposal/Report for:

Massachusetts Executive Office of Transportation

Net Change in Households in the South Coast Due to Development & Operation of the South Coast Rail

Prepared for:

Executive Office of Transportation
10 Park Plaza
Boston, Massachusetts 02116

Prepared by:

Economic Development Research Group, Inc.
2 Oliver Street, 9th Floor, Boston, MA 02109

August, 7, 2009

Induced Households

Purpose. Estimate the net change in households that are likely to move or stay within the 31 city and town South Coast Rail region (SCR) by 2030 due to new jobs generated by developing and operating the South Coast Rail. This will be done with what is commonly referred to as a "Sketch Planning" approach.

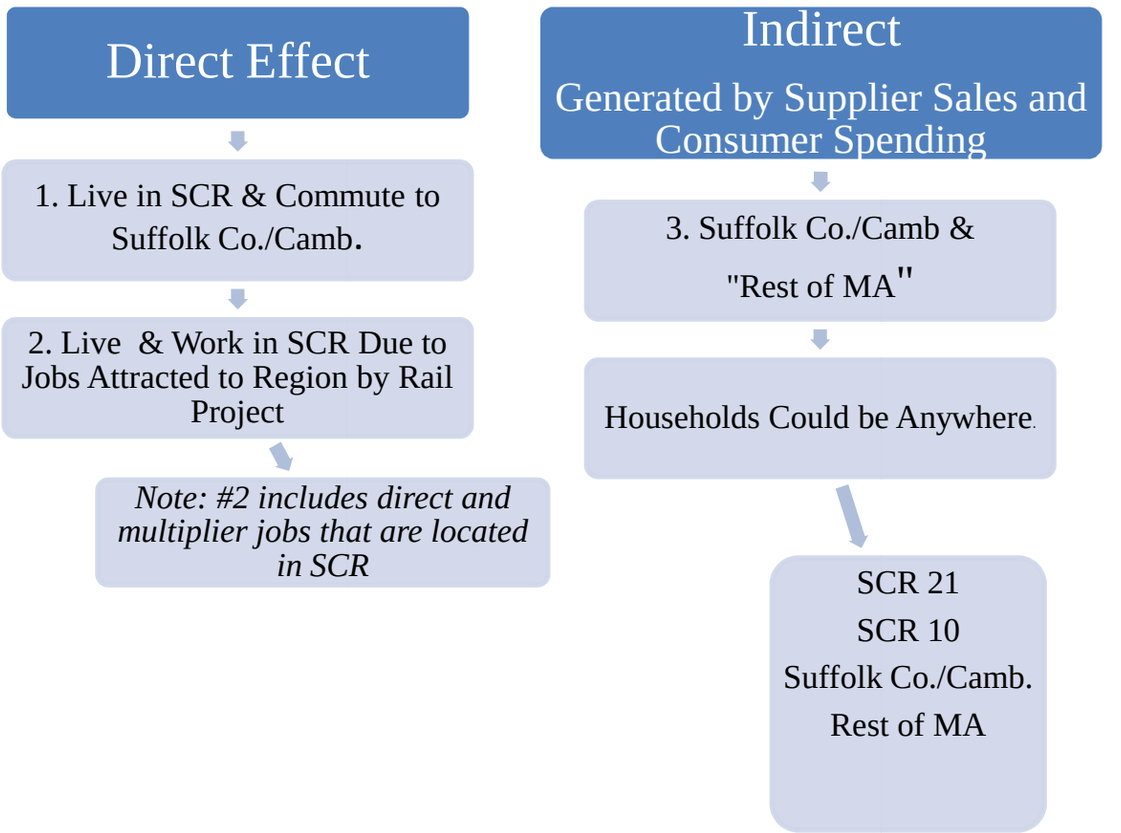
The Bottom Line. Operation of the South Coast Rail project as scheduled is expected to induce 1,100 – 1,800 more households within the SCR. The average for all alternatives analyzed is 1,500.

Alternatives

- Stoughton Electric
- Stoughton Diesel
- Attleboro Electric
- Rapid Bus
- Average – Based on the average inputs , not the average results

Analysis Segmentation Based on New Jobs in 2030 Generated by Operation of SCR

- Analysis includes three methods.



Method 1

Direct Jobs in Suffolk County and Cambridge

- New direct jobs in Suffolk County & Cambridge are by definition created by the rail.
- At this level of analysis it is impossible to determine exactly how many of the new jobs will be taken by existing SCR regional residents and how many will be by taken by people who move to the SCR region.
- Actual new households in the SCR will depend on the mix of new jobs in Suffolk County/Cambridge and the labor force match in SCR 21 and SCR10.
- This analysis assumes 50% of new direct jobs created by the presence of the SCR.

Direct Jobs In Suffolk County/ Cambridge		50% are assumed to result in new households in SCR These new households are assigned to SCR 21 and SCR 10 according to the ratio of new transit trips forecast by CTPS ***from*** these two subregions ***to*** Suffolk County/Cambridge. The split is roughly two-thirds from SCR 21 and one-third from SCR 10 per alternative.
SLE	460	
SLD	435	
BRT	269	
ALE	472	
Average	409	

Method 2

Attraction of New Households in SCR 21 and SCR 10 Based on Jobs Generated by the SCR in Each Region (p. 1 of 2)

This approach is based on comparing the types of jobs expected to be generated in the South Coast due to SCR with the existing mix of jobs in the region.

1. TREDIS output included expected employment by 2030 in 55 economic sectors for SC 21 and SC 10 generated by SCR operations.
2. Per subregion, each sector was divided by total 2030 employment. The resulting percentages show the concentration of each industry among the new jobs that are expected to be generated by the SCR in SCR 21 and SCR 10.

$$\frac{\text{New Employment Industry}_i}{\text{Total New Employment}} = \% \text{ Concentration for Industry}$$

3. This same operation was performed for current (2006) SCR 21 and SCR 10 employment.
4. The percents of new jobs due to the SCR (#2) were divided by the current concentrations (#3). The result is commonly referred to as a location quotient (or LQ).

$$\frac{\%\text{ Concentration for Industry New Jobs}}{\%\text{ Concentration for Industry Existing Jobs}} = \text{SCR 10 and SCR 21 LQs}$$

Jobs in SCR 21 and SCR 10 (p. 2 of 2)

5. An LQ of 1.0 indicates that the concentration of an industry in the South Coast due to the SCR is the same as its current strength. A higher LQ indicates that this is a relatively new industry (or strengthens a weak industry locally). We assume these industries are likely to attract new households. Interpretation is as follows.

Industry specific household formation in SCR 21 and SCR 10			
LQ		**Discussion**	**Percent of New Jobs that Result in New Households**
1	Below 0.8	Current SCR labor force in terms of skills, education and numbers are generally adequate for the new jobs that will be generated in these in industries. New household formation will be minimal.	10%
2	Above 1.2	These industries have the potential to transform the SCR economies, and will require education and skills. Therefore significant new household formation should be expected for new workers in these industries.	80%
3	0.8 – 1.2	These industries will be added to the SCR 21 and 10 economies at about the same levels as the current economies of each subregion. In terms of housing formation, a midpoint is assumed between high growth industries (#2) and minimal growth industries (#1)	45%

Method 3 (1 of 2)

Indirect and Induced Jobs in Suffolk County/Cambridge

The potential for new households in SCR was based on 2000 Journey to Work of the US Census (JTW), which shows that the commuting base for Suffolk County and Cambridge includes 1.6% representation from SCR10 and 4.0% from SCR 10.

Total workers in Suffolk County/Cambridge	622,873	
Suffolk/Cambridge workers who live in Suffolk-Cambridge	262,127	
Suffolk/Cambridge workers who commute from outside the region	438,019	
SCR21 commuters to Suffolk County-Cambridge	7,144	1.6%
SCR10 commuters to Suffolk County-Cambridge	17,579	4.0%
Total South Coast	**24,723**	**5.6%**

A. JTW Ratios for SCR

B. To this percentage we added a "bump" based on the increased 60 minute employee-employer access calculated by CTPS per alternative compared to the base case.

- For SCR 21: Factors of 2.14 -2.25 above JTW
- For SCR 10: Factors of 1.10 – 1.04 above JTW

C. Multiplying the JTW commuting percents (A) by the increase in access over a 60 minute transit ride (B) leads to the estimate that new households will be established in South Coast at:

- SCR 21 – 3.5% to 3.7% of indirect/induced jobs located in Suffolk County/ Cambridge
- SCR 10 – 4.1% - 4.2% of indirect/induced jobs located in Suffolk County/ Cambridge

Method 3 (2 of 2)

Indirect and Induced Jobs in Rest of Massachusetts

The potential for new households in SCR was based on 2000 Journey to Work of the US Census (JTW), which shows that the commuting base for the Massachusetts excluding the SCR and Suffolk County and Cambridge includes 3.6% representation from the South Coast. This analysis assumes that the establishment of the SCR will not influence new jobs created due to supplier relationships or consumer spending beyond existing patterns. Therefore a flat 3.6% was assumed as the rate of households induced in SCR from the indirect/induced jobs anticipated in the "Rest of Massachusetts."

Estimated Total New Households in SCR Region Due to Rail Project

	SLE	SLD	ALE	RB	Average All Alternatives
SCR21					
From Direct New Jobs in Suffolk County/Cambridge	150	140	150	100	140
From Indirect & Induced New Jobs in Suffolk County/Cambridge	10	10	10	10	10
From New Jobs in SCR Region	1,120	1,020	1,160	830	990
From New Jobs in Rest of MA	20	20	20	10	20
Subtotal	1,300	1,190	1,340	950	***1,150***
SCR10					
From Direct New Jobs in Suffolk County/Cambridge	80	70	80	40	70
From Indirect & Induced New Jobs in Suffolk County/Cambridge	10	10	10	10	10
From New Jobs in SCR Region	320	310	340	130	260
From New Jobs in Rest of MA	-	-	-	-	-
Subtotal	***420***	***400***	***440***	***170***	***350***
Total	**1,720**	**1,590**	**1,780**	**1,130**	**1,500**

Numbers are rounded to the nearest 10.
Columns may not add due to rounding.

Given the "sketch plan" nature of this analysis, the results should be assessed on the basis of orders of magnitude. SLE and ALE alternatives should be considered as equivalent, generating slightly more net households than SLD, which in turn generates more households than RB.

Smart Growth Literature Review

2

Literature Review

2.1 Introduction

This chapter provides a summary of the *Corridor Plan* and a review of experience in monitoring smart growth from relevant regional planning examples.

2.2 Summary of the South Coast Rail Economic Development and Corridor Plan

The *Corridor Plan*, prepared in June 2009, was developed as part of the proposed South Coast Rail project.[2] The Plan was developed through a collaborative process which resulted in a "blueprint for clustering jobs and homes around stations, maximizing the economic benefits or rail investment, minimizing sprawl development, and preserving the farms, fields, and forests of the South Coast." The *Corridor Plan* seeks to:

- Advance the Commonwealth of Massachusetts' Sustainable Development Principles;
- Advance a robust effort to preserve critical environmental resources as the region's population grows;
- Optimize development around train stations;
- Target investment in places where infrastructure is already in place;
- Encourage collaborative land use planning across municipal boundaries; and

2 Commonwealth of Massachusetts. *South Coast Rail Economic Development and Land Use Corridor Plan.* June 2009.

- Provide supportive state policies and investments to cities and towns.

The *Corridor Plan* is comprised of three elements: Priority Development Areas (PDAs), Priority Protection Areas (PPAs), and Station Area Development. PDAs include major downtowns, large employment centers, locations around future South Coast Rail stations, and other areas that have been identified as having the potential to support business or residential growth. The PPAs include farmlands, sensitive habitat and environmental resource areas, potential linkages between existing open space resources, and places of cultural or historic significance. The *Corridor Plan* also evaluates the potential for TOD around future stations.

As described in the *Corridor Plan*, the locations of new South Coast Rail stations were selected and designed to address several key public goals: to serve existing residential and employment centers within the region; to foster new development around stations; to accommodate people arriving by a range of different modes including car, bus, foot and bike; and to address the operational needs of the rail system and provide access for future riders. These new stations fall into four basic categories: multimodal hub, new center, village station, and park-and-ride station. The *Corridor Plan* sets forth a number of goals for station and station area development:

- Approach each station site as a unique design opportunity to achieve the site's highest potential while optimizing development and parking potential system-wide;
- Plan for economic and housing development at station sites and catalyze smart-growth investments within the one-mile station radii;
- Provide adequate and equitable parking options that respect the community character;
- Provide safe, convenient access to and from the stations for all modes of transportation; and
- Design station areas and station parking to be environmentally-friendly and energy-efficient.

The *Corridor Plan* also includes a number of policies, tools, and strategies that offer municipalities and public agencies a range of tactics to implement the *Corridor Plan*. Although the *Corridor Plan* focuses primarily on the involved state agencies and the South Coast region municipalities, technical assistance from the Regional Planning Agencies (Southeastern Regional Planning and Economic Development District [SRPEDD], the Metropolitan Area Planning Council [MAPC], and the Old Colony Planning Council [OCPC]) to the local municipalities will be required for successful implementation of these policies, tools, and strategies. The *Corridor Plan's* suggested policies, tools, and strategies include the following.

State Agencies

- Maximize use of TOD to create great places at the station areas by:
  - Creating multimodal and public-realm connections to stations, including investments in bicycle and pedestrian access;
  - Incorporating solar, photovoltaic, wind, district energy, and energy-efficient technologies and green building standards for stations, parking facilities, and station areas;
  - Planning for short- and long-term TOD opportunities and seek out public ownership of land for station areas; and
  - Coordinating job creation, green job incubators, and employer-attraction initiatives with station area development.
- Direct discretionary state funding to encourage zoning and land use changes in support of sustainable development.
- Steer their own investments in state infrastructure, buildings, and office leases to station areas and priority development areas.
- Provide technical assistance to expand affordable housing opportunities within the PDAs.
- Create a Transfer of Development Rights (TDR) program to steer growth away from PPAs and other sensitive locations to PDAs.
- Capture new tax revenue from growth around new stations for reinvestment.

State Agencies and Regional Planning Agencies

- Provide technical assistance to municipalities.

Municipalities

- Create a foundation for sustainability community development through planning. This could be accomplished by creating:
  - Master or Comprehensive Plans;
  - Community Development Plans (CDP);
  - Open Space and Recreation Plans;
  - Housing Production Plans;
  - Water and Sewer Plans;
  - Watershed Protection Plan; and
  - Specific Station-Area Plans.
- Utilize strategies and tools to achieve preservation including:
  - Adopting the Community Preservation Act;

- Protecting agricultural land and activities through adoption of agricultural zoning or right-to-farm bylaws, conservation subdivision bylaws (cluster development), TDR bylaws, and scenic road bylaws.
- Preserving historic resources through adoption of demolition delay bylaws and establishing historic districts or designating landmarks;
- Protecting other sensitive areas through the adoption of design review bylaws; and
- Protecting wetlands through adoption of local wetland protection bylaws, use of low impact development techniques, and development of stormwater management plans.

- Utilize strategies and tools for the promotion of development including:
  - Using Chapter 43D[3] to promote development in the PDAs;
  - Redeveloping contaminated sites using the technical and financial assistance from brownfields redevelopment programs;
  - Using Chapters 40R and 40S[4] and tax-increment financing and district-improvement financing to support private development;
  - Adopting zoning changes that support TOD, higher densities, and mixed use developments;
  - Developing parking-management strategies and allow shared parking; and
  - Adopting housing-related policies including inclusionary zoning, accessory dwelling units, multi-family housing, Chapter 40B[5], and the Community Preservation Act.

Table 2-1 outlines the responsibilities of the state agencies, the regional planning agencies, and the municipalities in achieving the goals set out in the *Corridor Plan*.

3 Massachusetts General Law Chapter 43D offers communities a tool for targeted economic development. Also known as local expedited permitting, if a municipality opts in, Chapter 43D provides a transparent and efficient process for municipal permitting; guarantees local permitting decisions on priority development sites within 180 days; and increases the visibility of the community and target development sites.

4 Chapter 40R of the Massachusetts General Laws encourages cities and towns to establish new overlay zoning districts to promote housing production and, more generally, smart growth development. Chapters 40R and 40S both provide financial incentives to communities to adopt these new zoning districts.

5 Massachusetts General Law Chapter 40B enables local Zoning Boards of Appeals to approve affordable housing developments under flexible rules in 20 to 25 percent of the units have long-term affordability restrictions.

Table 2-1 Implementation Responsibilities of the South Coast Rail Corridor Plan

Action	Responsible Entity
Technical assistance, funding, regulation, and legislative proposals to implement the state agency actions.	State – Development Cabinet
Update the *Corridor Plan* each year and refine the implementation strategies.	State – All agencies
Provide technical assistance to communities for smart growth implementation and to advance PPA and PDA goals.	State – All agencies
Develop more detailed station-area plans and station-area zoning.	State – MassDOT, EOHED, MBTA Regional Planning Agencies Municipalities
Continue civic engagement activities to foster public dialogue and discussion of the *Corridor Plan*, incorporating public input into design of South Coast Rail Project.	State – MassDOT
Continue to work with Regional Planning Agencies using Direct Local Technical Assistance funding to support implementation of actions at the local level.	State – EOHED Regional Planning Agencies
Continue to provide technical assistance to corridor communities to enhance smart growth planning, encourage TOD in station areas, and assist corridor communities with implementation of PPAs and PDAs.	State – EOHED Regional Planning Agencies
Build on and advance planning for PDAs and PPAs within the Corridor Map and other regionally and locally identified PDAs and PPAs.	State – All agencies Municipalities
Draw on technical assistance to explore potential application of smart growth tools and ordinances consistent with community goals and the *Corridor Plan*.	Municipalities
Prepare station area plans to guide investment around future stations through additional analysis and planning, as well as through engagement of the public, property owners, and developers.	Municipalities
Consider revisions in local regulations, including zoning where necessary, in order to reposition station areas to attract appropriate development.	Municipalities

PDA Priority Development Areas

The *Corridor Plan* does not identify metrics that would measure the success of the implementation strategies identified in Table 2-1. The Secretary of EOEEA, in his Certificate on the Draft Environmental Impact Report for the South Coast Rail project, required that MassDOT develop metrics that would serve to determine the effectiveness of the plan implementation. The metrics should monitor and measure

the potential smart growth and environmental benefits from the *Corridor Plan* implementation. Specifically, based on the goals outlined in the *Corridor Plan*, detailed metrics are required for the following categories:

- EIS/EIR and General metrics;
- Priority Development Area metrics;
- Transit Oriented Development metrics;
- Conservation and Priority Preservation Area metrics;
- Social Equity metrics.

The specific metrics will measure how well the goals of the *Corridor Plan* are being implemented by the South Coast region municipalities, regional planning agencies, and state agencies through the policies, tools, and strategies identified in the *Corridor Plan*.

2.3 Literature Review

As there are no metrics or indicators included in the *Corridor Plan*, MassDOT undertook a literature review as directed by the Secretary's Certificate on the DEIS/DEIR. Beginning with existing models and performance metrics in Massachusetts, MassDOT reviewed the effectiveness of these models and metrics in evaluating smart growth and environmental protection strategies. MassDOT also reviewed examples from across the nation for applicability to the South Coast Rail project.

Massachusetts does not have any state-wide legislative mandate to utilize smart growth principles. While there are no state-wide legislative mandates, Executive Order 525 mandates that state agencies implement the commitments identified in the *Corridor Plan.* Executive Order 525, issued by Governor Deval Patrick in September 2010, provides for the implementation of the *Corridor Plan*.[6] Executive Order 525 directs state agencies to make infrastructure and land protection investments consistent with the priority areas identified on the Corridor Map of the *Corridor Plan*. The priority areas include 33 priority development areas (PDAs) and 72 priority protection areas (PPA) and one combined PDA/PPA. Massachusetts' state agencies are now using the *Corridor Plan* to guide investments in infrastructure and land protection, and to target technical assistance where it is most needed. In order to facilitate smart growth planning efforts by communities in the South Coast Region, a total of $300,000 per year has already been provided over four years in technical assistance to plan for smart growth in South Coast communities. The Executive

6 Commonwealth of Massachusetts. *Executive Order 525: Providing for the Implementation of the South Coast Rail Corridor Plan.* September 29, 2010.

Order mandates policy commitments made in the *Corridor Plan* for "Strategic Investments" by committing the Commonwealth to use its discretionary grant funds and its investments in state buildings and infrastructure to support the recommendations of the *Corridor Plan*.

In order to provide technical assistance to all communities throughout the Commonwealth, the Massachusetts Executive Office of Energy and Environmental Affairs has developed a Smart Growth/Smart Energy Toolkit[7] which provides information and technical assistance to a variety of users, including planners, developers, and designers, who are interested in implementing smart growth principles for individual projects or communities. The Smart Growth/Smart Energy Toolkit provides examples of Massachusetts communities utilizing the individual tools identified in the toolkit to implement smart growth principles, but no examples are provided of comprehensive smart growth planning linked to specific metrics to monitor the implementation of smart growth principles.

As there were no other state-wide examples or regional examples of existing models and performance metrics, the research included states across the nation. Five case studies were examined in further detail:

- San Diego's *Regional Comprehensive Plan*
- *Maryland Smart Growth Indicators Project*
- Puget Sound Regional Council's *VISION 2040* and Growing Transit Communities
- Atlanta Regional Commission's Livable Centers Initiative
- New Jersey Transit Village Initiative

This selection of case studies provides some context for the performance metrics that were later developed for the South Coast Rail project. In some cases, follow-up phone interviews with planners involved with the implementation of these plans were completed. The purpose of phone interviews was to get more detailed information on the status of the case studies and on the metrics used to measure the success of these plans.

In addition to the study of select regional plans and performance metrics, reports and guidance documents from federal agencies, transportation research organizations, and non-profits such as the Center for Neighborhood Technology and the Brookings Institute were reviewed. A full list of the sources consulted is provided in Chapter 7, *References*.

7 Massachusetts Smart Growth/Smart Energy Toolkit. Available: http://www.mass.gov/envir/smart_growth_toolkit/index.html

2.3.1 San Diego's *Regional Comprehensive Plan*

The *Regional Comprehensive Plan* (RCP) serves as the long-term planning framework for the San Diego region.[8] While the RCP is not specifically a corridor plan, there is a strong smart growth component which focuses development within Smart Growth Opportunity Areas and promotes habitat conservation within designated preserve areas. The RCP was adopted by the San Diego Association of Governments (SANDAG) Board of Directors in June 2004. The RCP defined a vision and identified goals, key issues, and needed actions in areas ranging from urban form and transportation to public facilities and borders. The RCP characterized the state of the region at the time of adoption, where the region aims to be by 2030, and what the region needs to do to achieve this vision of the future.

The RCP specifically required ongoing monitoring to track progress toward meeting the goals outlined in the plan. The Annual Indicators for Monitoring included metrics to measure the progress related to urban form and transportation, housing, healthy environment, economic prosperity, public facilities, and borders. Many of the strategies and actions recommended in the RCP will take years to develop and fund. Therefore, SANDAG staff indicated it is important to have a consistent and valid set of indicators that can reflect sometimes subtle changes that occur over the long run.[9] Performance monitoring reports on these indicators will assess how the RCP is influencing the quality of life in the San Diego region.

The RCP Baseline report for Performance Monitoring was completed in late 2006 and it established the benchmark for future annual monitoring. The 2009 RCP Monitoring Report was the third report to be published and was distributed in September 2010.[10] SANDAG had been reporting annually, but it became an intensive task for the SANDAG staff prompting the decision to report findings bi-annually rather than annually.[11] The changes that were seen in the data were quite small and did not necessarily show any trends from year to year. It is not expected that reporting bi-annually will show any trends either from report to report but over the long term the monitoring will reveal trends.

The RCP reports on approximately 35 to 40 indicators currently (Table 2-2). The list of indicators is revised periodically as new plans are adopted, to reflect indicators included in those plans. As described in the 2009 Monitoring Report, many of the indicators use the American Community Survey (ACS) as the data source. The ACS program of the U.S. Census Bureau collects and disseminates demographic, socioeconomic, and housing data on an annual basis. Data are collected from one of every 40 addresses, or approximately 2.5 percent of the population, for a total of about three million addresses a year. Other indicators are based on data that

11 Early, Christine, Planner, San Diego Association of Governments. Personal Communication. February 28, 2012.

SANDAG routinely collects in order to limit the burden on staff and regional communities. Still other indicators were removed since attempts to identify data sources have not been successful. The RCP will be updated in 2014/2015. At that time, the indicators will be revisited.

Table 2-2 SANDAG Indicators for Monitoring the *Regional Comprehensive Plan*

2.3.2 *Maryland Smart Growth Indicators Project*

The Maryland Smart Growth Program was introduced by former Governor Parris Glendening in 1997 and passed by the Maryland General Assembly. The program has two main parts: the Smart Growth Areas Act and the Rural Legacy Program. The program encourages new growth in already developed areas, where adequate infrastructure and public facilities currently exist, and thus protects natural resources, farmland, and forests. The program is usually referred to as an incentive-based, rather than a regulatory, program: it provides state funds for infrastructure development in designated Priority Funding Areas (PFAs), and funding and other incentives for the protection of land outside of PFAs. The goals of Maryland's Smart Growth initiative are expressed in broad terms. The general goals of the program are:

- To support and enhance existing communities; and
- To save taxpayers from the cost of building new and often redundant infrastructure.

In 2009, as part of the Smart, Green, and Growing Planning Legislation, the Maryland General Assembly passed two major updates to the state's Smart Growth Program that are relevant to the question of performance measurement.[12] The Planning Visions bill (SB 273/HB 294) revised the State's growth visions to 12, which more comprehensively address the broad impacts of growth and collectively describe an integrated vision for sustainable development in Maryland. These 12 visions could logically be used as categories of areas that the State wants to influence and, thus, wants to measure to see if it is in fact having any influence. The second, the Smart Growth Goals, Measures, and Indicators and Implementation of Planning Visions bill (SB276/HB295), requires counties in Maryland to report certain data relating to the visions on an annual basis to the Maryland Department of Planning (MDP). MDP, in turn, is required to work with the National Center for Smart Growth Research and Education (NCSG) at the University of Maryland to gather additional data from state and federal sources and annually report on these measures and indicators of growth to the Governor and General Assembly. The legislation established a goal of increasing the percentage of growth within PFAs statewide, and required counties to set their own goal for the percentage of future growth that would occur within their PFAs.

The reporting required from Maryland counties under the Smart Growth Goals, Measures, and Indicators and Implementation of Planning Visions bill began in July 2011; however, the NCSG began to collect and report on a variety of indicators more recently to permit a better understanding of where smart growth in Maryland was succeeding and where it needed improvement. The indicators are grouped into

12 2009 Smart, Green & Growing Planning Legislation including the Smart and Sustainable Growth Act of 2009 (SB 280/HB297), the Smart Growth Measures and Markers (SB276/HB295), and Planning Visions (SB273/HB294).

eight categories: Population, Economy, Environment, Land Preservation, Infrastructure, Transportation, Housing, and Land Use. Most of the data came from readily available sources, such as the U.S. Census Bureau and various Maryland state agencies (Table 2-3). The NCSG attempted to choose meaningful data that tell a story without over simplifying or creating unnecessary complexity.[13]

The NCSG reported its findings on the *Maryland Smart Growth Indicators* website.[14] While the website compiles historical data for each indicator as available, there are no firm plans for the publication of the indicators in the future due to funding constraints. Looking back to the historical data, the NCSG cautions that change happens slowly over time, and it will be difficult to truly evaluate how Maryland's smart growth legislation has had a measurable impact on development.[15]

2.3.3 Puget Sound Regional Council's *VISION 2040* and Growing Transit Communities

In April 2008, the central Puget Sound region in Washington state adopted one of the most detailed and far-reaching sustainability strategies for an urban region in the United States. *VISION 2040* is the long-range, integrated, environmental, land use, economic development, and transportation strategy for a four-county region.[16] *VISION 2040* was developed through a public scenario planning and evaluation process over a three-and-a-half-year period. Under the state growth management planning framework, *VISION 2040*'s policies guide the development of regional implementation plans, local comprehensive plans, and their implementing development regulations. *VISION 2040* includes a monitoring plan to provide policymakers and the public with answers to the following four key questions:

- Is our region developing in a manner that is consistent with our Regional Growth Strategy?

16 Puget Sound Regional Council. VISION 2040. December 2009.

- Do our activities in this region minimize harm to and protect and sustain the natural environment?
- Is our economy strong, and does it provide opportunity for all?
- Do we have a variety of efficient and safe transportation choices that support our growth strategy and offer greater options and better mobility?

Regional monitoring is based upon two major components: implementation monitoring and performance monitoring. Implementation monitoring assesses whether what was committed to is being done. Performance monitoring assesses whether the plan is achieving the desired results. The regional monitoring measures include metrics related to environment, development patterns, housing, economy, transportation, and public services (Table 2-4).

Table 2-4 PSRC's *VISION 2040* Implementation and Performance Monitoring Measures

Topic	Type	Monitoring Measure	Data Source
Environment	IM	Existence of a coordinating mechanism and environmental strategy	Local jurisdictions
	PM	Change in type and distribution of land cover, and related to designated critical areas	Aerial photography Impervious surface analysis
	PM	Water quality and impaired waters designations, by county	Washington Department of Ecology Water Quality Assessment
	PM	Number of unhealthy air days	Puget Sound Clean Air Agency
	PM	Annual average emissions of greenhouse gases	Puget Sound Clean Air Agency
	PM	Track local jurisdictions' efforts to address climate change and other environmental policies	PSRC
Development Patterns	IM	Adopted local population/housing unit and employment growth targets in countywide planning policies	Local jurisdictions
	PM	Development densities and distribution and quantity of designated urban, rural, agriculture, forest, and mineral resource lands. This includes distribution of new issued permits by regional geography	County urban, rural and resource land comprehensive plan designations PSRC
	PM	Body Mass Index, by sex and race, by county	Washington State Department of Health U.S. Centers for Disease Control
Housing	IM	Existence of a coordinating mechanism and housing strategy	PSRC
	PM	Distribution of issued housing permits by regional geography and by county, in order to assess jobs-housing balance and other issues	PSRC
	PM	Supply and distribution of ownership and rental housing units at all income levels by regional geography and by county; affordable housing availability by amount and location; review of local housing elements and plans; tracking of implementation and outcomes; reporting on successes and challenges	U.S. Census Private consultants

Table 2-4 PSRC's VISION 2040 Implementation and Performance Monitoring Measures (continued)

Topic	Type	Monitoring Measure	Data Source
Economy	IM	Demonstrated progress in addressing foundation and cluster initiatives, action items; employer and job locations	Review of Washington's Prosperity Partnership PSRC Local comprehensive plans
	PM	Number of jobs and real wages per worker by employment/industry categories and economic clusters by county, and unemployment rates at subarea level matching state database	Washington State Employment Security Department PSRC
	PM	Number of post-secondary degrees awarded per 1,000 individuals of targeted population groups, and high school completion rates	National Center for Education Statistics Washington State Board for Community and Technical Colleges Office of the Superintendent for Public Instruction
Transportation	IM	Metropolitan Transportation Plan project priorities, funded projects, and completed projects	PSRC Transportation Improvement Program databases
	PM	Travel mode splits, travel times, and delay by county and major corridor, and by regional geography (including designated centers)	U.S. Census PSRC Washington State Department of Transportation
	PM	Traffic volumes, transit boardings, and delay by major corridor, by county and regional geography (including designated centers)	U.S. Census PSRC Washington State Department of Transportation
	PM	Total and per capita vehicle miles traveled, by region, county and major corridor, and by regional geography (including designated centers)	U.S. Census PSRC Washington State Department of Transportation
Public Services	PM	Adequacy of infrastructure capital and operating financial resources	Washington State Department of Transportation PSRC Association of Washington Cities

IM Implementation Measure
PM Performance Measure
PRSC Puget Sound Regional Council

With funding provided by the U.S. Department of Housing and Urban Development Sustainable Communities Regional Planning Grant Program, the PSRC implemented Growing Transit Communities to address the barriers to implementation of the *VISION 2040* plan.[17] With the addition of three new Sound Transit light rail lines, Growing Transit Communities will help local communities to take advantage of the new light rail service, bus rapid transit and other transit investments, with the goal of

17 Bakkenta, Ben. Program Manager, Puget Sound Regional Council. Personal Communication. March 6, 2012.

locating jobs and opportunity closer to where people live. A major product of Growing Transit Communities will be Corridor Action Strategies which will detail the actions and tools needed to make it easier to develop jobs and housing in areas associated with transit investments. Acknowledging the need for safe, secure, quality affordable housing in the region, Growing Transit Communities will develop funding and finance tools and offer technical assistance to housing providers and local jurisdictions. Catalyst demonstration and case study projects in the corridor neighborhoods will implement existing plans and serve as templates for the region's sustainable development.

At this time, the PRSC and its partners are completing an existing conditions report. By the end of 2012, the Corridor Action Strategies will be developed creating a common vision of the unique roles and opportunities at each of the station areas within the corridors, and identify specific issues, priorities, and potential projects. Work elements will include data-based analyses of existing transit and demographic conditions in the corridors, and the development and transmittal of recommendations for how to accelerate the scope and scale of TOD. PSRC will identify regionally significant development opportunities and strategies for catalyzing high quality, equitable TOD in these areas. Grants given out by PSRC will provide jurisdictions, transit agencies, and other stakeholders support in determining how best to use high capacity transit to link residential communities with regional employment centers, and support participating jurisdictions in adopting land use policies that encourage equitable TOD and the preservation and development of affordable housing and commercial space.[18] Activities will result in the development of corridor-based compacts among affected jurisdictions, communities, agencies, and other stakeholders. The corridor compacts and strategies will be the basis for that common vision.

The PSRC's Growing Transit Communities is a strong example of how technical assistance from regional planning commissions can support the planning for new transit corridors. PSRC has given small equity grants to non-profit groups and other community groups active in the proposed rapid transit corridors. With a focus on capacity building, these funded projects will gather information on community values and needs, engage underrepresented communities to help inform the Corridor Action Strategies, and help ensure existing and future communities around transit provide opportunities for diverse populations. To date, there have been no publicly accessible performance metrics for PSRC's Growing Transit Communities program.

18 Bakkenta, Ben. Program Manager, Puget Sound Regional Council. Personal Communication. March 6, 2012.

2.3.4 Atlanta Regional Commission's Livable Centers Initiative

The Atlanta Regional Commission (ARC) adopted the Livable Centers Initiative (LCI) in 1999, with the purpose to help planners and governments more effectively link current and future land use planning to existing or planned transportation infrastructure.[19] The program has enabled the ARC communities to proactively plan for enhanced employment centers, town centers, and transportation centers improving these area's livability. The LCI program has also been able to reduce vehicle miles traveled within the ARC's service area by locating the LCI areas near existing transportation centers.[20] Through the LCI program, local governments and other organizations compete for planning grants to fund studies of future development strategies. Those communities that have adopted the LCI plans are then also eligible to receive design and construction funds for the transportation projects that help implement the plans. There are approximately 111 LCI areas, including town centers, and employment and activity centers.

In addition to the preparation of LCI plans, each LCI community must reassess the LCI with a five-year and ten-year update. This evaluation component is a report on the accomplishments of the LCI community based on goals identified in the LCI plan. The evaluation plans also allow the ARC to gauge which LCI communities need additional technical assistance.[21]

The ARC uses biannual implementation surveys to gather information from each local government that has completed an LCI study in order to track and evaluate the successes and challenges experienced within the LCI community. The 2010 survey included a development inventory and a questionnaire on five topics: built developments, policies, transportation, livability, and LCI plan components. Each biannual survey has two parts: a development matrix and a set of survey questions. The development matrix is used to track development numbers, such as the number of residential units, number of hotel rooms, and commercial square footage, based on the new projects in each LCI. The survey is used to track perceptions and the process. This two-pronged approach allows the ARC to track how well the LCI program is doing in both numbers and through attitudes thereby assessing the effects of the LCI program on development.[22] Each new survey is updated and builds upon the previous year's survey. A sample of the survey questions from 2010 is provided in Table 2-5.

LCI: Livable Centers Initiative

The implementation reports that the ARC prepares biannually seek to determine, among other things, the forms of development that are taking place in LCI areas, and how policies and regulations have changed in LCI communities to reflect the goals of the LCI program. They also examine the benefits and impacts the LCI plans, policies and resulting projects might have on the region as a whole. The implementation reports are available through the ARC website at: http://www.atlantaregional.com/land-use/livable-centers-initiative/.

2.3.5 New Jersey Transit Village Initiative

The New Jersey Transit Village Initiative is a state-based program to promote TOD in New Jersey. The program is staffed and directed by the New Jersey Department of Transportation (NJDOT), and has a task force made up of other state agencies to guide the direction of the initiative. To be designated as a Transit Village, a community would apply to the Transit Village Task Force and demonstrate through experience and planning that it supports the principles of the Transit Village Initiative, including compact development, transit-supportive land uses, and a high-quality pedestrian environment.[23] The Transit Village is designated as the half-mile area around the transit facility. Its aim is to reduce traffic congestion and improve air quality by promoting increased transit ridership, pedestrian activity, and bicycle use. In addition, the goals of economic revitalization and increasing the housing stock are part of an overall effort to create vibrant, enjoyable, and exciting areas around major transit nodes. The benefit of being a Transit Village is that this designation not only gives these municipalities priority consideration for state grants but also allows the municipalities to have direct contact with the representatives of these agencies. As of 2012, there are 24 Transit Villages located on the various transit lines in the state.

In early 2005, the NJDOT worked with the Voorhees Transportation Center (VTC) at Rutgers University to prepare an Annual Municipal Reporting Form for the Transit Village Initiative Program.[24] The purpose of the form is to gauge development activities in the Transit Village District and to assess the strengths and weaknesses of each municipality in finding and reporting development data. The form has four sections: construction activity, grants and incentive programs, other Transit Village activity, and additional comments and suggestions. When the Reporting Form was originally presented to Transit Villages, the VTC and NJDOT found that many of the host communities did not have the staff to gather and provide the requested information, and therefore, reduced the number of indicators that would monitor progress. These indicators are presented in Table 2-6. As of 2005, NJDOT had not implemented the monitoring process recommended by the VTC.[25]

2.4 Summary

As directed in the Secretary's Certificate on the DEIS/DEIR for the South Coast Rail Project, existing plans smart growth and monitoring programs from across the United States were identified and reviewed for applicability to the proposed project. The purpose of the review was to identify metrics or indicators that may be used to evaluate implementation of the *Corridor Plan* with respect to PDAs, the PPAs, and the Station Areas. A total of five existing plans/programs were reviewed; three in depth including interviews, and two based on a review of existing, readily available materials.

A significant difference between the plans and programs review and the South Coast Rail Project is that there is no legislative mandate in Massachusetts that controls growth through the planning process. However, this does not mean that the goals and objectives of the *Corridor Plan* cannot be implemented; only that participation by the local communities would be voluntary rather than compulsory. Data collection to support the metrics and indicators would be accomplished through cooperation between state agencies, regional planning agencies, and local governments.

A number of commonalities were evident in the literature review and subsequent interviews. Data were typically collected every two years. In the case of SANDAG's RCP monitoring, the SANDAG staff had begun by collecting and reporting data every year. Collecting and reporting on the RCP progress every year became an extremely staff- and time-intensive task prompting SANDAG to revise the reporting

timeframe to every two years. As noted by other interviewees, reporting every year will not show any major trends. Change happens slowly and therefore, the performance metrics or evaluation indicators chosen should be descriptive without being overly complicated or too simplified. A number of well-developed metrics or indicators under a high level category may be needed to describe trends as illustrated by the large number of measures used by SANDAG and the PSRC for their *VISION 2040.*

Many of the metrics and indicators reviewed are simple metrics that could be reported with numbers. Others are more complex to report. Through the interviews completed, it was clear that metrics and indicators that reveal the performance trends without being too complex or overly simplistic are ideal. Similarly, data that are readily available is the simplest way to track metrics and indicators. The U.S. Census Bureau was often used due to the large amounts of data that are collected. In the case of the San Diego's *Regional Comprehensive Plan* and the Puget Sound Regional Council's *VISION 2040* and *Growing Transit Communities*, the regional planning agencies were the source of the data used to fulfill the metric or indicator. Other government agencies, and in very few cases, independent entities outside of the government, supplied data as well.

RE: Request to be a Cooperating Agency for the preparation of an Environmental Impact Statement for the South Coast Rail Project in Massachusetts

Dear Colonel Feir:

This letter responds to your March 17, 2009 request for the Environmental Protection Agency (EPA) to participate as a cooperating agency during the preparation of the Environmental Impact Statement (EIS) for the South Coast Rail Project proposed by Massachusetts Executive Office of Transportation and Public Works. EPA New England agrees to participate as a cooperating agency during the preparation of the EIS for the project.

EPA intends to work as a cooperating agency within the limit of our resources to help define the scope of analysis, identify sources of information and to offer input on how specific issues should be addressed in the EIS. We encourage the Corps to continue to coordinate closely with local, state and federal agency representatives throughout the NEPA process.

If you have any questions about this letter or EPA's involvement in the EIS process, please contact Timothy Timmermann at 617-918-1025.

Sincerely,

Elizabeth A. Higgins, Director
Office of Environmental Review

Subject: South Coast Rail Project

Dear Mr. Feir:

We are writing to respond to your March 17, 2009 request for the Federal Highway Administration (FHWA) to participate as cooperating agency during the preparation of the Environmental Impacts Statement (EIS) for the South Coast Rail Project. The project intends to link Boston with the cities of New Bedford and Fall River, Massachusetts. The US Army Corps of Engineers (COE) is the lead agency for the preparation of the EIS pursuant to section 102(2)(c) of the National Environmental Policy Act (NEPA) of 1969 and its implementing regulations contained in 40CFR 1500-1508.

The FHWA hereby accepts your invitation to participate as a cooperating agency. In particular, we will be providing input within our expertise and jurisdiction in the development of alternatives that satisfy the purpose and need of the project.

Please contact Damaris Santiago at (617) 494-2419 should you have any comments or questions.

Sincerely,

Lucy Garliauskas
Division Administrator

Re: **South Coast Rail Environmental Impact Statement**

Dear Colonel Feir:

The Federal Transit Administration (FTA) has reviewed the letter from the Army Corps of Engineers dated March 17, 2009 inviting the FTA to be a Cooperating Agency in the preparation of a Federal Environmental Impact Statement for the proposed South Coast Rail project. The FTA looks forward to participating in the environmental review process. The FTA Region I's point of contact is Peter Butler. Peter can be reached at 617-494-2729 or peter.butler@dot.gov.

Sincerely,

Mary Beth Mello

for Richard H. Doyle
Regional Administrator

Subject: RE: Federal EIS - South Coast Rail, Massachusetts

Sensitivity: Confidential

Dear Mr. Anacheka-Nasemann:

FRA belatedly accepts your invitation to serve as a cooperating agency for the South Coast Rail EIS. We apologize for the delaying in responding. FRA will serve as a cooperating agency to lend our special expertise related to railroad planning and due to the potential for impact to the Northeast Corridor intercity rail service operated by Amtrak. Mr. Cogswell will provide comments to you regarding the technical railroad planning and operations analysis that have been prepared for this project.

The FRA HQ Office of Railroad Development is responsible for all planning and environmental activities and all EIS coordination should be conducted through this office. It is appropriate for the Cambridge office to be consulted on safety issues.

Sincerely,

David Valenstein
